Async Tabletop Wizards — UI review including gameplay

2026-10-21

- Review scope
  - Reading the mockups
  - Navigation overview
  - Layout choices being proposed
  - Source of behavior
  - Suggested review
  - A01 — Sign in
  - A02 — Create account
  - A02b — Registration: lower form
  - A03 — Password reset email
  - A04 — Set a new password
  - N01 — Main menu
  - N02 — Shared Menu / Games navigation
  - P01 — Games and invitations
  - P05 — Name and create a game
  - P03 — Long-press game context
  - P04 — Confirm active shared-game deletion
  - P02 — Contacts and new game
  - D01 — Saved decks
  - D02 — Saved deck details
  - D03 — Import with unresolved names
  - D04 — Resolved new import and save
  - D04b — Import review: save controls
  - D07 — Edit → Import decklist
  - D08 — Full card/art inspection
  - D05 — Choose a deck cover
  - D06 — Delete a saved deck
  - L01 — Retained inviter lobby after decline
  - L02 — Accepted lobby before own deck selection
  - L03 — Select a game-local deck copy
  - L04 — Prepare mainboard and sideboard
  - L04b — Latest-transfer text faded, layout unchanged
  - L05 — Own Ready accepted
  - L06 — Cancel an unstarted game
  - U01 — Reconnecting and return to games
  - G01 — Live table and fixed hand
  - G02 — Live combat and populated Stack
  - H01 — Historical review paused at an exact event
  - H02 — Grouped playback running
  - H03 — Historical continuation armed before first action
  - G03 — Explicit Redo and mode chooser routes
  - G04 — Card context actions
  - G05 — Tokens, numbered pings and reveal placement
  - G06 — Retained card actions after edits
  - G07 — Life and player-counter context menu
  - G08 — Life drag: positive preview before release
  - G08b — Player-counter drag: negative preview
  - G09 — Direct game-chat panel
  - G10 — Compact overflowing hands
  - H04 — First event stays centered
  - H05 — Final event stays centered
- Copy audit — suggested further deletions
- Whole-journey interaction budgets
- Coverage and limits
- Provenance and review artifacts

Review scope

Draft for owner review. Structure matters; style is provisional. This is the Stitch-based UI documentation pilot and gameplay extension, not an approved final interface or a working Android app. Confirmed branding: **Async Tabletop Wizards**; subtitle: **Specialized tabletop simulator for asynchronous wizardry** (D-292).

Review editions: PDF download · Markdown source.

Cumulative owner direction: feedback and explicit supersessions. Later rounds retain earlier decisions unless the owner explicitly changes them. This full document is republished at the same browser-refresh URL after changes. The D-292–D-297 cumulative revisions below are confirmed direction; remaining geometry/style proposals are not silently approved by this round.

Both **portrait and landscape are required** (D-290). Each screen below has a 412 × 892 portrait capture and an 892 × 412 landscape capture. These are logical pixel/dp-like design viewports, not physical screen pixels or a promise about every Android device. The landscape image is a real rendering of the responsive design at the short, wide viewport—not a rotated or stretched portrait image.

The packet covers account entry, navigation, games/invitations, contacts, saved decks, import and lobby preparation, plus the **D-291 gameplay extension**: live table, fixed Hand, responsive Stack/combat, paused/running history, armed historical continuation and the explicit Redo route. D-294 removes obsolete G00 from the current packet and replaces U01’s empty backdrop with a real table. G04–G08 add card/owner/player actions, token/ping/reveal examples and signed player-value drag previews (G08b is the negative-preview

continuation). G09/G10 and H04/H05 add game chat, overflowing hands and centered timeline endpoints. Full zone menus, gameplay-specific inspectors and result-ending overlays still need completion; D08 is a deck-context inspection reference and P04 the separate active-delete confirmation.

Reading the mockups

- **Icon + text button (D-293 default):** a meaningful icon with a short action label, such as “Ready” or “Accept.” A leading icon is not an unlabeled icon button.
- **Icon button:** contextual Close/Exit or password-visibility eye; no app Back/home arrows. The proposed normal target is at least 48 × 48 logical pixels, with an accessible name.
- **Label/status:** descriptive text such as “Ready,” “Invitation pending,” or a card count. A checkmark complements text rather than replacing it with color.
- **Field:** an explicitly labeled text input, search input or multiline pasted list. Password contents are not silently trimmed or normalized.
- **Thumbnail:** an abstract placeholder with a card-name fallback. No production card artwork was requested for this pilot. D-293 deck rows put a small art thumbnail immediately after quantity; press it or the row for full inspection.
- **Muted action:** unavailable, with a visible reason. It is not a future feature hidden behind a paywall or an instruction to bypass a failed requirement.
- **Scroll:** long lists and forms scroll within their content panel. Main actions must remain reachable in both orientations; an initial viewport is not the entire possible list. On-screen keyboard, large-text and split-screen variants still need their own later visual checks.

Fullscreen (D-292): no system status/navigation strip or dedicated app-title bar. Necessary hamburger, contextual exit, phase/history and other actions remain compact in-screen controls, not branding chrome. Ordinary labels, game-state feedback and errors are not forbidden “status bars.” Review targets remain roughly 16 px outer margins, 12 px gaps and 48 px controls, without reserving fake system-bar space. Native cutouts, temporary OS bar reveal, keyboard and accessibility still need safe placement/verification; these are not implemented Android claims. **D-294:** no app Back/home arrow **anywhere**, superseding the authentication-only rule. “Back” below always means Android native Back, not an app arrow. Titled screens share one hamburger/title row (landscape persistent navigation replaces hamburger); titles never disappear in landscape. Import/editor **Exit without saving** is at its far right. Dialog X is top-right. Related button pairs fill their row equally, 50/50. Compact preparation **1 / ∞** markers are 24 px wide, an explicit exception to the earlier 48 px-wide handle draft, with native accessible alternatives and no overlapping invented touch regions; ordinary buttons stay 48 px. **Button density:** almost always show an appropriate icon, plus text when there is space. Tight gameplay actions use icon-only controls with accessible names; mode/phase and numerical game-state values must remain identifiable. Top-level Menu/Games categories are text; their indented entries and Logout have icons.

Important: these are static mockups. Their behavior is specified in the notes, not demonstrated by functioning buttons. An incidental label/decoration in a generated image does not authorize a feature that contradicts those notes.

Navigation overview

```
Sign in ↔ Create account
   └─ Forgot password → email link → New password → Sign in
Hamburger navigation (persistent on landscape non-gameplay screens)
   ├─ Menu → main menu (Games / Manage decks / Contacts)
   │   ├─ Manage decks → deck inspector → Edit → rename / cover / import / delete
   │   │              └─ bottom Import deck → resolve → save new
   │   └─ Contacts → username search → Add contact → Invite
   ├─ Games → games browser (Games first, Invitations afterward)
   │   └─ each current game → its table or lobby, according to lifecycle state
   │       ├─ In play → G01 live table ↔ H01/H02 history
   │       └─ Setup → choose/prepare deck → Ready
   └─ Logout (fixed footer outside scroll area) → signed-out entry
Games browser → Accept invitation → same lobby
              └─ New game → Contacts → Invite → name game → Create & invite → lobby
Lobby → both Ready → G01 live table
Game-row long press → setup Cancel / active Delete → extra active-delete confirmation
```

```
Deck Edit → Import decklist → Overwrite (default) / additive Merge → resolve → save
History → Continue playing from here → H03 armed intent
    ├─ Cancel / Return to live → no shared change
    └─ first successful mutation → active continuation
```

Back leaves a screen; it is not a game cancellation, Ready withdrawal, gameplay Undo or publication step. Rotation preserves the current screen and surviving in-process input/selection; it does not repeat a request or submit an unfinished form. Saved decks, contacts and games synchronize across devices, but unfinished forms and personal navigation are not automatically cross-device shared state.

Layout choices being proposed

The following remain **UI proposals**, not new behavior approvals: Contacts' "Invite" placement, list/grid arrangements outside the confirmed D-292 navigation, authentication forms other than A01's selected same-card composition, two-column landscape panels, import review/save routing, cover-selection confirmation and remaining destructive-action geometry. D-295 selects a games-list-only reconnect escape. "Random" is selected in the example lobby state; these images do not choose a universal initial starter default or retention policy.

For gameplay, the owner selects a trial own Hand hovering above the fixed bottom controls in portrait, sharing the quick-action row in landscape (D-297), responsive Stack/combat, hold Undo for Redo and pause-on-drag history. Own green/opponent red bands, colored life squares and orientation-specific left/middle special-zone controls follow the cumulative direction. Covered opponent Hand in the landscape top control row, exact life placement, phase/mode shapes and camera geometry remain proposals. See G01–G06 and H01–H03; agreement to try a layout is not approval of final sizes or a passed UI gate.

Existing rules are applied without asking for approval again: no guest/social login, contact approval, full saved-deck builder, score archive, host Start, extra Send, online-presence requirement, automatic opening draw, in-game Sideboard or in-app notification mute controls.

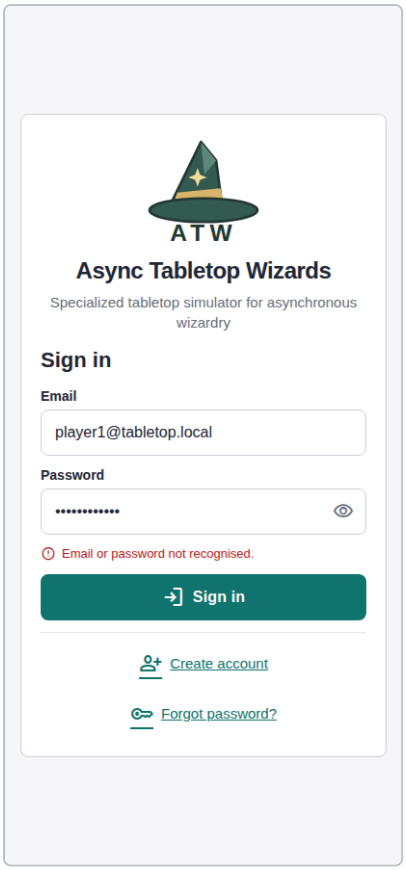

Source of behavior

The primary repository source is `docs/design/03-contracts/accounts-decks-and-lobby.md`. The Android experience contract and technical notification profile add platform/recovery constraints. Gameplay additionally follows `board-and-controls.md`, `history-and-undo.md`, `history-grouping.md`, `combat-stack-and-projections.md` and the clarified `../gameplay-screen-proposal.md`. These are source anchors, not extra required reading to understand the packet's interaction notes. These source references are repository documents, not extra pages required to read the hosted packet. Decision references below identify already agreed behavior; the particular control geometry remains proposed.

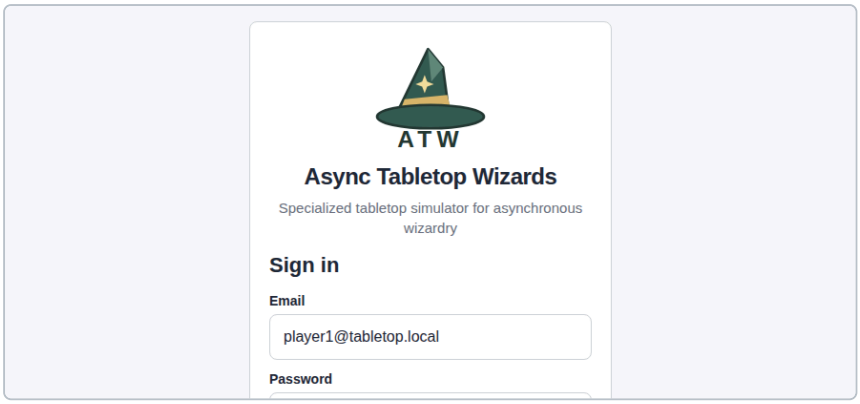

Suggested review

Refer to a screen ID and orientation, for example "L04 landscape: make the sideboard narrower." Review the hierarchy, approximate space allocation, icon-versus-text choices, visibility of actions and the state transitions. Colors, fonts and borders remain provisional; the app name/subtitle are confirmed.

A01 — Sign in

A01 portrait — sign-in form with example error

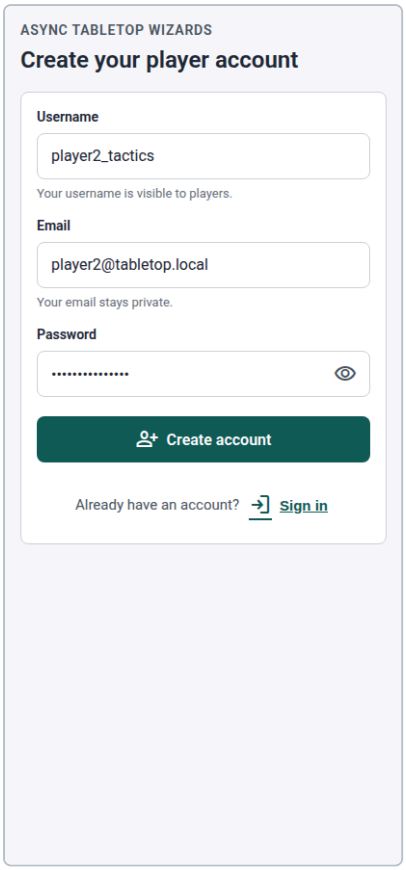

A01 landscape — same centered login card, scrollable at short height

Layout (confirmed D-292): both orientations center the **same bounded login card**, including ATW logo (D-297) and app name/subtitle, without a landscape intro/form split. The short landscape viewport scrolls this unchanged card rather than shrinking targets or switching composition. Email and Password are text fields; the eye is an icon button. Sign in, Create account and Forgot password are labeled actions. The image deliberately includes an example credential error; a clean initial form omits that message.

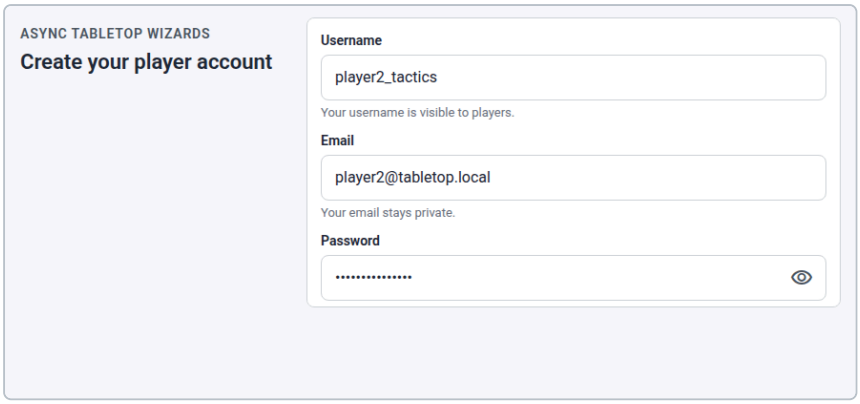

Interaction: Sign in submits credentials. Failure keeps inputs available for correction; success opens the main menu or resumes the same-account return context. A valid existing login skips this screen across ordinary restarts and inactivity. No guest entry, alternate social provider or routine session expiry. Password visibility is personal UI only. Back does not sign another device out.

Basis: D-188, D-197, D-217, D-249, D-268, D-289, D-292.

A02 — Create account

A02 portrait — labeled registration fields

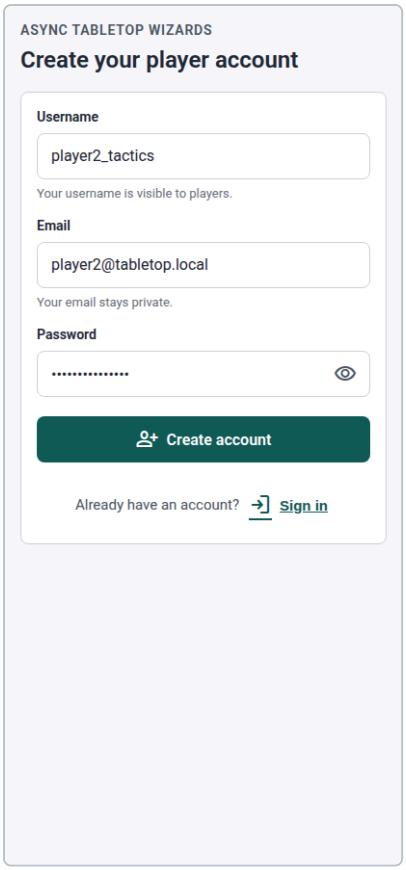

A02 landscape — compact registration layout

Layout: Username, Email and Password are fields. The password eye is an icon; Create account and Sign in are text actions. Landscape uses the width for an intro/form split and allows the form panel to scroll, not smaller touch targets.

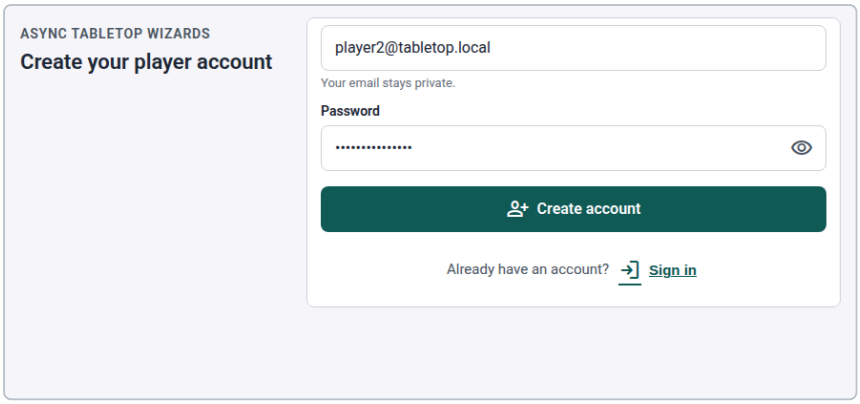

Interaction: registration uses these three credentials; username is public player identity while email is private. Invalid input/network failure stays on this form with a specific inline explanation and preserved editable input. The proposed successful route returns to A01 with a success notice and known email populated; it does not invent an email-verification gate. No confirmation password, social login or profile editor is required by this draft. Password whitespace/Unicode handling stays consistent with sign-in and reset.

Basis: D-197, D-249; success navigation and exact feedback are UI proposals.

A02b — Registration: lower form

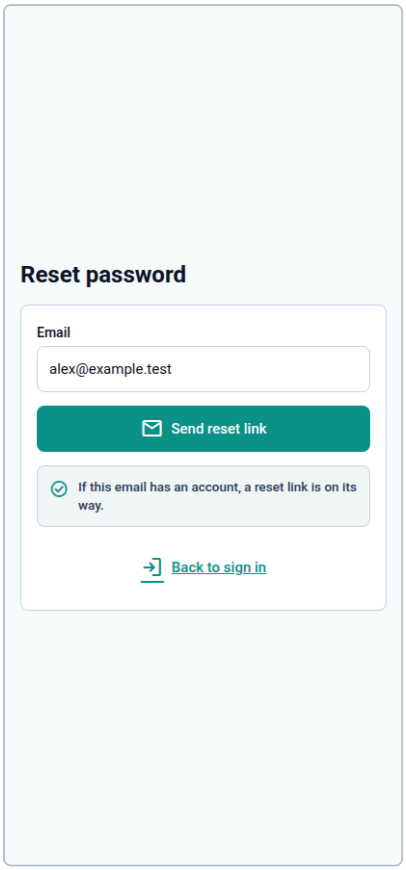

A02b portrait — registration form, no scrolling needed

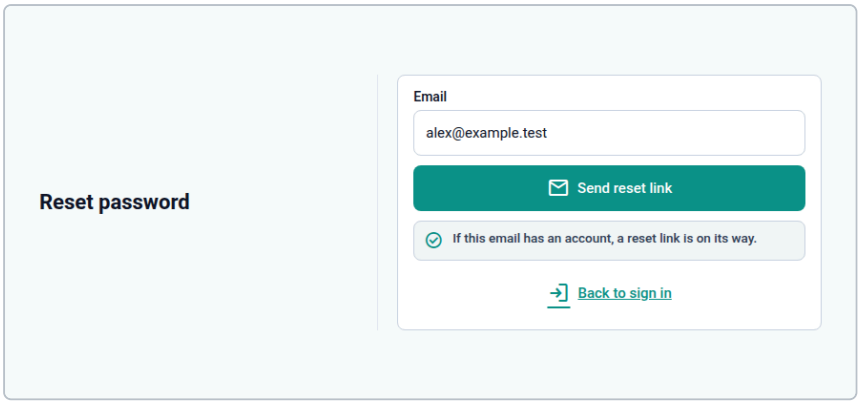

A02b landscape — form scrolled to Create account and Sign in

Same screen, different scroll position: the short landscape form panel is scrolled to its bottom to expose Create account and the Sign in link at full touch size. The portrait form fits already, so that capture is unchanged. This is not a separate registration step, new server state or submission. It makes the landscape scrolling cost visible rather than hiding it in the tap budget.

A03 — Password reset email

A03 portrait — reset request submitted

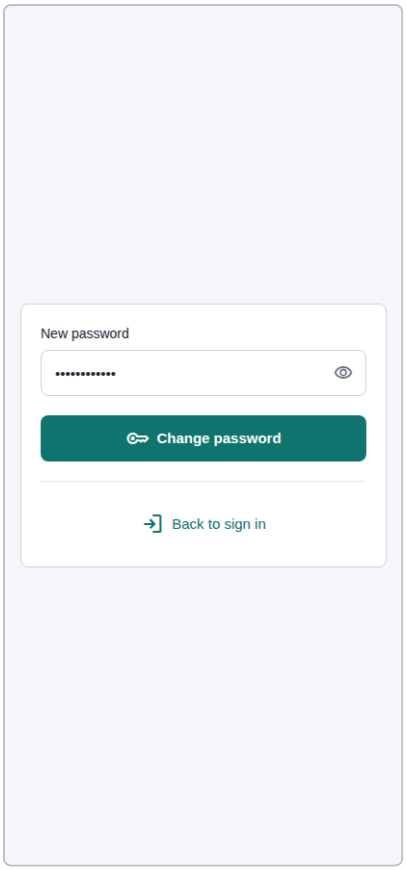

A03 landscape — reset request submitted

Layout: one Email field, Send reset link text button, neutral submitted-state notice and Back to sign in. The initial state uses the same structure without the submitted notice. No session/sign-in explanation on the screen (D-292). The sample email is synthetic, not account data.

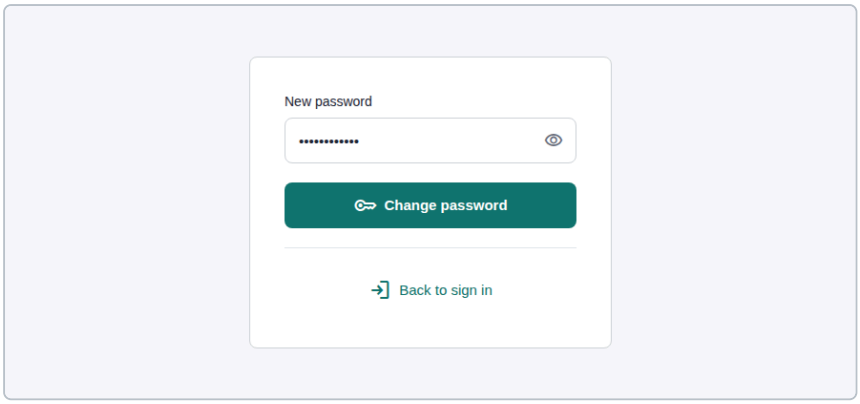

Interaction: request an email reset link without revealing whether that address is registered. A delivery/request failure keeps the address editable and shows a retryable inline error; it does not claim the password changed. Merely requesting or opening a reset link does not revoke sessions. The successful email-link flow continues at A04, not an invented six-digit-code screen.

Basis: D-197, D-279; neutral response follows the authentication profile.

A04 — Set a new password

A04 portrait — valid password-reset link

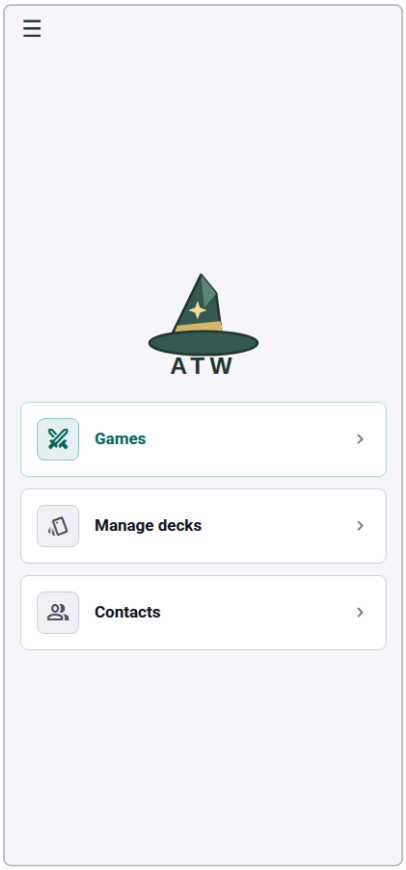

A04 landscape — valid password-reset link

Layout: New password is a field; its eye is an icon button. Change password is a text button. The valid reset-link state is shown. Email and username are not additional editable account settings here. Remove session/sign-in explanations and generic reassurance copy from the screen (D-292); the behavior below remains. The compact form is centered without an empty landscape explanation panel.

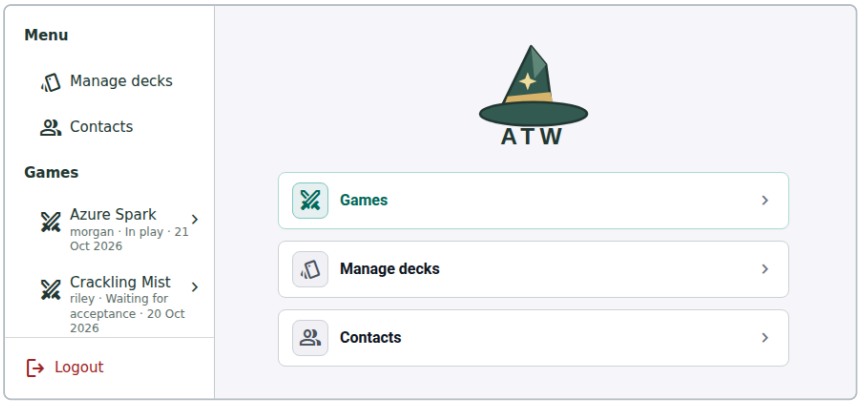

Interaction: successful reset changes the password and revokes existing sessions for new requests, then returns to Sign in with a success notice. An expired/invalid/already-used link instead shows a non-actionable error and a Request another link route to A03; it does not submit a reset or revoke sessions. Do not silently trim password contents. Already-authorized/in-flight requests may still finish normally; the UI must not promise recall of those operations.

Basis: D-197, D-249, D-279, D-289. Alternate link/error state is described here but not separately pictured in this pilot.

N01 — Main menu

N01 portrait — main destinations and hamburger, no utility links

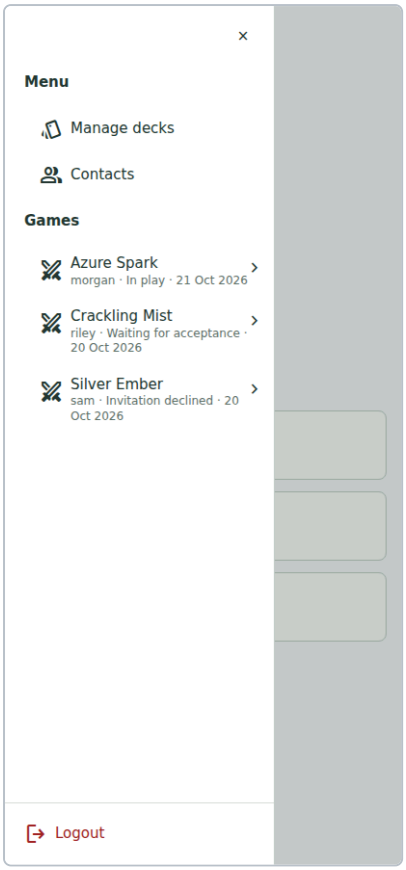

N01 landscape — compact main-menu layout

Layout (D-292/D-293): an **ATW** logo sits above Games, Manage decks and Contacts. The pictured wizard hat is a provisional motif, not final approved logo artwork. Destinations are large icon-plus-text destinations, without explanatory subtitles/marketing text. No notification-settings or direct Logout link in main-menu content. Landscape includes the shared persistent navigation; portrait uses the hamburger. See N02 for its open state.

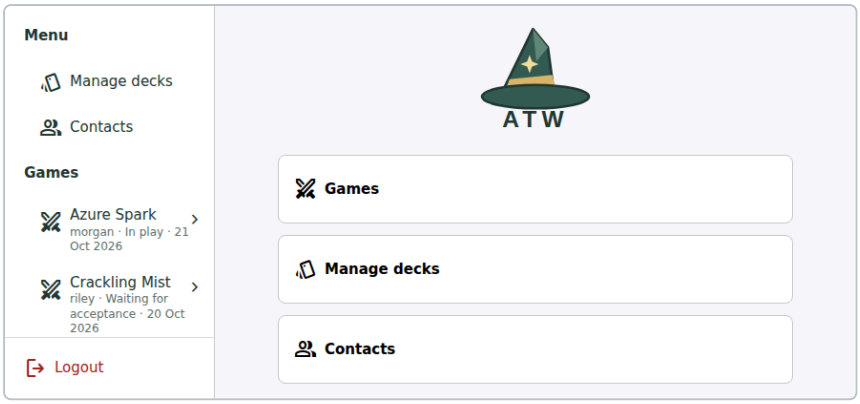

Interaction: Games opens P01; Manage decks opens D01; Contacts opens P02. Logout from the navigation footer immediately clears this device’s login and private downloads, returning to A01 without deleting server games/decks or logging out independent devices. Remote revocation is best effort. This proposed layout does not add a routine logout confirmation or expose account-email data in shared player lists.

Basis: D-188, D-196, D-218, D-220, D-241, D-282, D-289, D-292.

N02 — Shared Menu / Games navigation

N02 portrait — open hamburger drawer with fixed Logout footer

N02 landscape — persistent navigation beside main-menu content

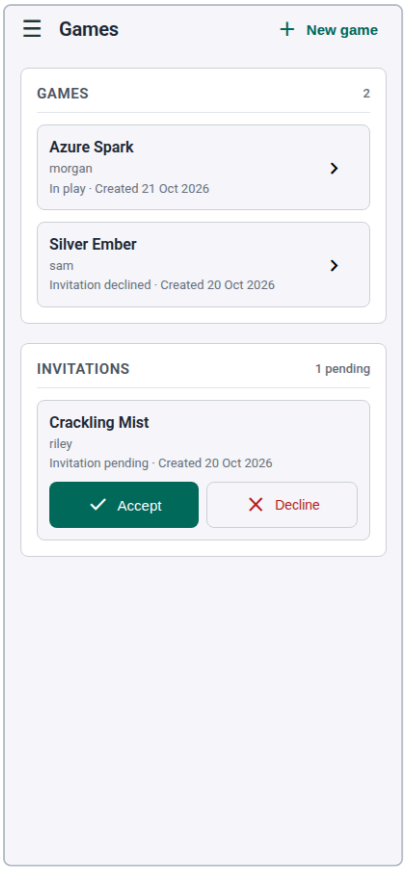

Confirmed structure (D-292): Menu and Games are clickable top-level destinations, not expand-only headers. Menu opens N01; its indented subitems are Manage decks and Contacts only. Games opens P01; its indented list contains each current game, including waiting/preparation states, not a separate Lobbies category. Task screens needing a selected deck/game stay in their contextual routes. **D-293:** indented destinations/game entries and fixed Logout each have an appropriate icon; corresponding main-menu options use the same symbols. Menu and Games top-level categories remain text. Game entries omit “With”; a chevron opens the current context. Long press/accessibility actions use P03/P04’s lifecycle rules.

Scrolling: the category/subitem/game area scrolls independently; Logout stays in a fixed non-scrolling bottom footer. Portrait hamburger opens this drawer; Close, Back or tapping outside dismisses it without a shared change. Landscape non-gameplay screens always show the navigation alongside content. Gameplay in either orientation keeps it collapsed until the hamburger is used; it must not permanently reduce the landscape board. A modal temporarily blocks background navigation until dismissed. Rotation retains the current destination and unfinished input while switching navigation presentation, not issuing another request.

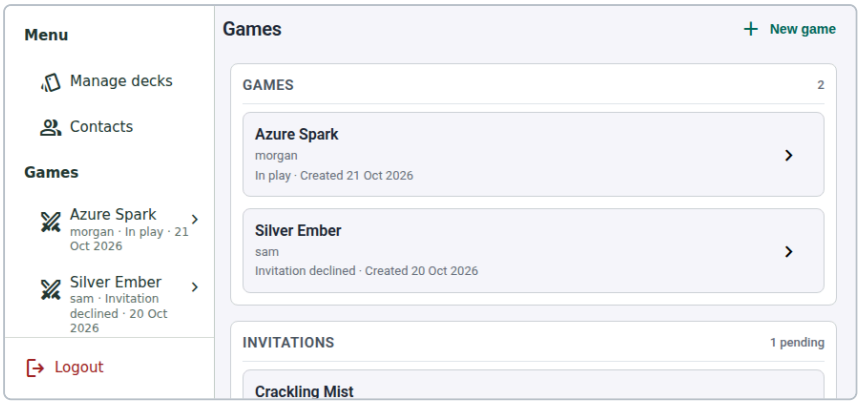

State: game rows open that same game’s current table or lobby. Setup → play, return-to-lobby, acceptance and cancellation update the same listing under existing server lifecycle rules; no duplicated “lobby versus game” identity. Incoming invites not yet accepted remain in P01’s Invitations section, not playable own-game rows. Example usernames/status labels are synthetic; row geometry remains reviewable.

Provenance: locally composed inert design derivative, not a new Stitch screen or working navigation. The surrounding screenshots apply the same shared shell.

P01 — Games and invitations

P01 portrait — combined Games list followed by Invitations

P01 landscape — navigation beside Games, with Invitations afterward

Layout (D-292/D-294): one Games list contains in-play and setup/lobby states; Invitations follows it, not before or as a separate left-hand first column. Accept/Decline and New game use icons + labels. The **required game name** is the primary label; opponent identity is metadata. Creation date appears beside state in the details. No “With”/“Game with” prefix; Open is just a right chevron. Necessary lifecycle status labels distinguish rows without inventing a structural Lobbies category. The same order applies in landscape, beside persistent navigation; lists scroll.

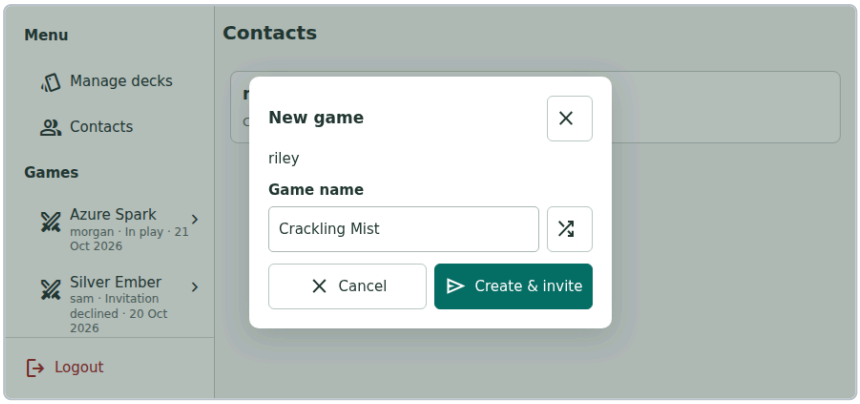

Interaction: Accept enters the exact existing lobby as L02, without Ready or an immediate start. Decline retains the inviter’s lobby/preparation/Ready. Reinvite is **inside** that lobby, not a Games-row action, and never creates a replacement game. Long press/accessibility opens P03’s context menu; active Delete requires P04’s extra confirmation and removes the shared game for both players. Invitations do not expire automatically; cancelling a game removes its invitation and current listing. Open active game reaches G01; a setup row opens its existing lobby. New game opens P02. An empty list would show “No current games” with New game, not a finished-game archive.

Basis: D-188, D-195, D-208, D-209, D-214, D-287, D-292. Empty/loading states are not separate mockups yet; no unread/read, presence or result statistics are implied.

P05 — Name and create a game

P05 portrait — required editable fantasy game name and suggestion reroll

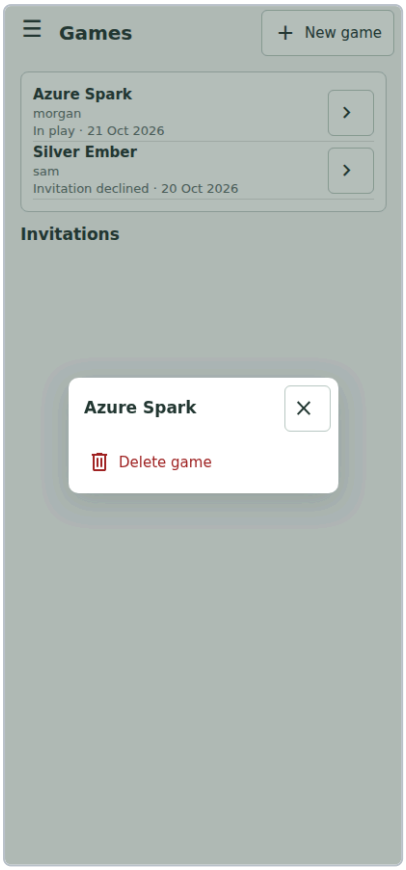

P05 landscape — naming before atomic creation and first invitation

Confirmed (D-294): name every newly created game, offering procedural fantasy/ wizarding **adjective + thing** suggestions: Azure Spark, Crackling Mist, Silver Ember. The pictured composition prefills an editable suggestion and offers a shuffle/reroll icon. Accepting a nonblank generated name is sufficient; forced typing is not required. Empty/whitespace-only input blocks creation. This state follows selecting an added contact and pressing Invite; **Create & invite** alone creates the named game and its first invitation atomically. Cancel/close/native Back and reroll create nothing. Typing is optional additional interaction cost.

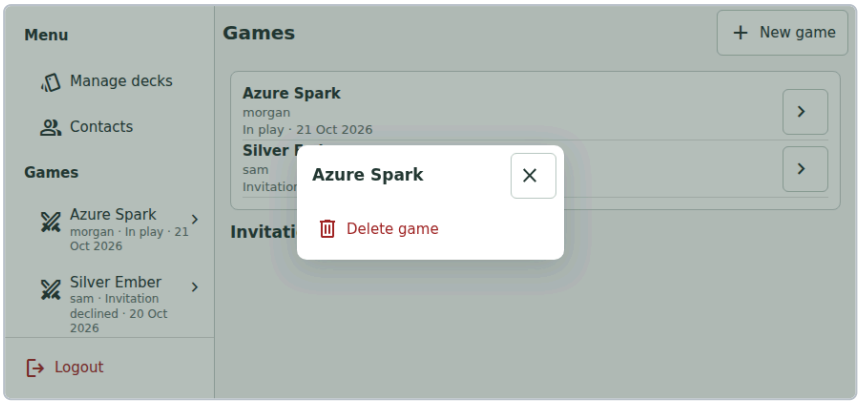

D-295: this is a bounded dialog over Contacts in both orientations, with one title and top-right close. Touch/focus selects all current name text for immediate replacement, including a generated suggestion; keyboard/accessibility focus gets the equivalent selection. Selection does not reroll, submit or create a game. Subsequent editing still supports normal text selection. The sources are inert: the select-all requirement is annotated, not claimed as a working HTML gesture.

The server assigns the persistent game’s creation instant on acceptance. Display its date beside state in details and the name as the game/lobby/table title; opponent identity remains available. The date/name survive acceptance, decline/ reinvite, starts and returned-lobby/fresh-play cycles, and synchronize across participants/devices. Retry keeps original name/time/IDs, never generates a fresh game. Names are labels, not unique identities. Local draft suggestions are not gameplay RNG/history. No rename UI, archive or new expiry rule is inferred.

P03 — Long-press game context

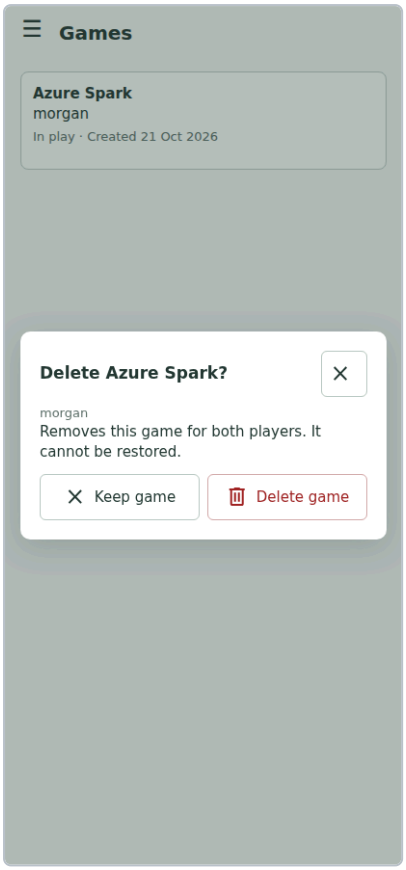

P03 portrait — active-game long-press menu

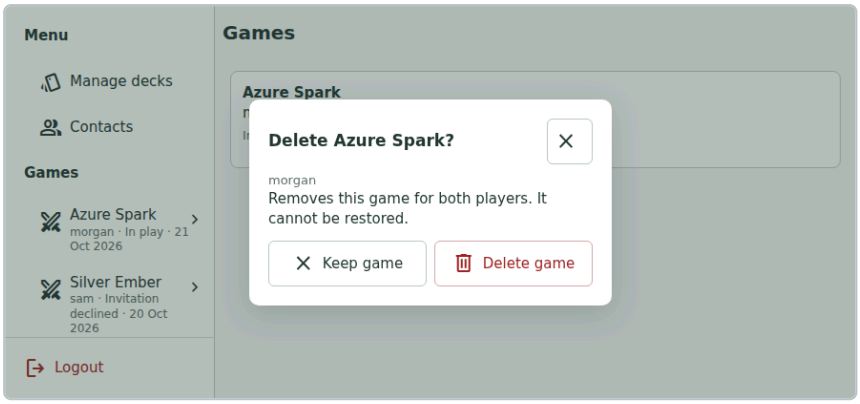

P03 landscape — bounded game context menu

Confirmed (D-293): long press a Games or navigation game row; do not also open it. Active play offers icon + **Delete game**; setup instead offers icon + **Cancel game**, retaining the existing L06 cancellation route. Dismiss/native Back/outside tap leaves the game unchanged. No Reinvite in the list/context menu: open the existing lobby for it. Equivalent explicit native accessibility actions are required. Choosing active Delete only opens P04; the hold/menu choice alone sends no deletion.

P04 — Confirm active shared-game deletion

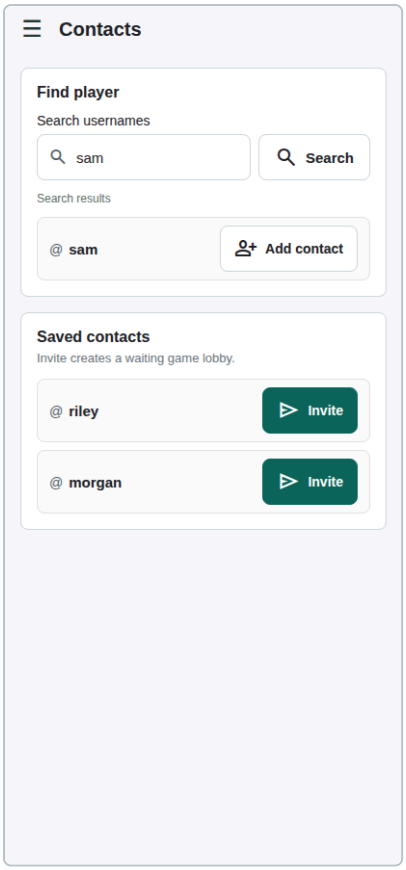

P04 portrait — extra confirmation names the game and both-player removal

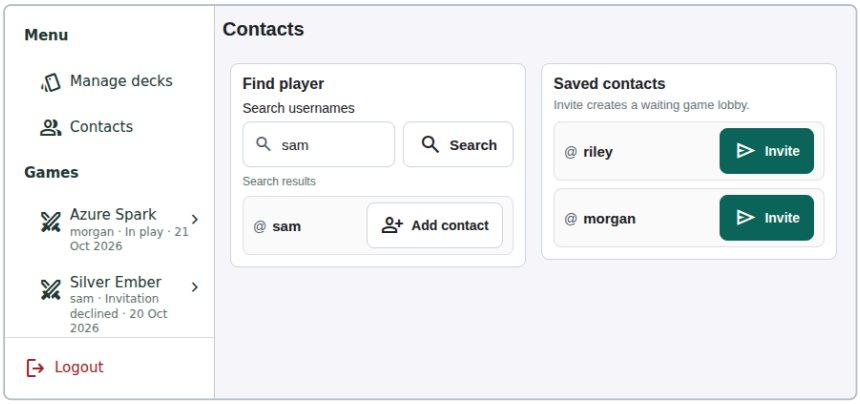

P04 landscape — active-game deletion confirmation

Owner clarification: active games also have Delete, with this **extra dialog**; confirmed removal is for **both players**, not hide-for-me. Keep game/native Back sends nothing. Confirm requests deletion of the captured game and active incarnation through the server. Success removes listings/access for both and leaves for Games; there is no result, reusable lobby, Undo or restore. This is separate from normal cooperative result suggestion/acceptance. A stale confirmation after return/fresh start fails rather than deleting a different incarnation. Retry recovers the same outcome; a timeout is not proof of success. No instant disconnected-device erasure or permanent server/backup destruction is promised. Scope warning is essential decision copy, **not** an expendable tutorial paragraph.

P02 — Contacts and new game

P02 portrait — saved contacts and username search

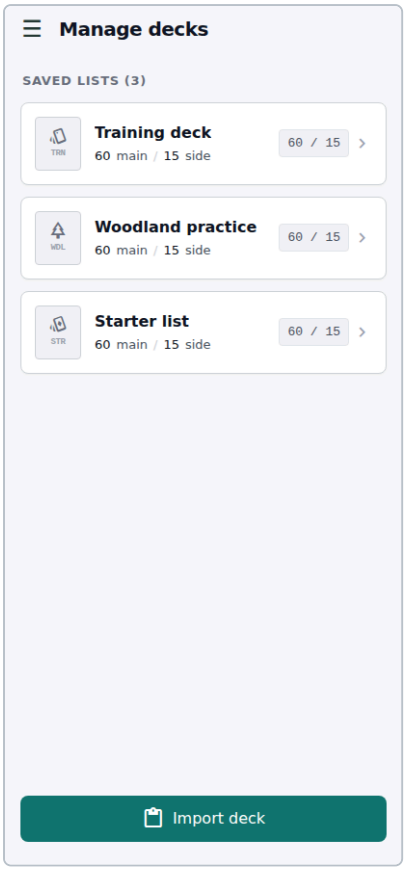

P02 landscape — search results beside saved contacts

Layout: Search usernames is a field; search magnifier is a supporting icon. Search, Add contact and Invite are labeled text actions. Saved contacts and search results remain separate collections, but **D-296 search results are inside the same card as the search field**, not a second results card. Apply this to every already-in-scope search, including its loading/empty/error feedback. No email addresses or online-status dots.

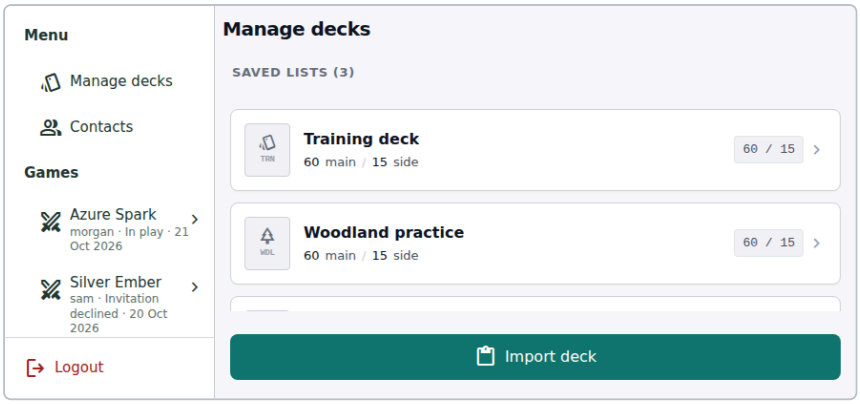

Interaction: Search produces explicit username matches; Add contact saves a contact directly with no friend-request approval. A newly saved contact gets Invite in the contact list. D-294 Invite opens **P05 naming**, not an unnamed game. Create & invite then creates one game plus first invitation and opens its lobby; this required naming step supersedes the old immediate-create route, without an additional confirm-the-confirmation or automatic recipient acceptance. No results uses an inline “No matching usernames” notice, not a missing-user substitution. Removing contacts is not invented by this pilot.

Basis: D-195, D-196, D-197, D-218. Exact search matching is not settled by these example names or the placement of the Search button.

D01 — Saved decks

D01 portrait — named saved decks and Import

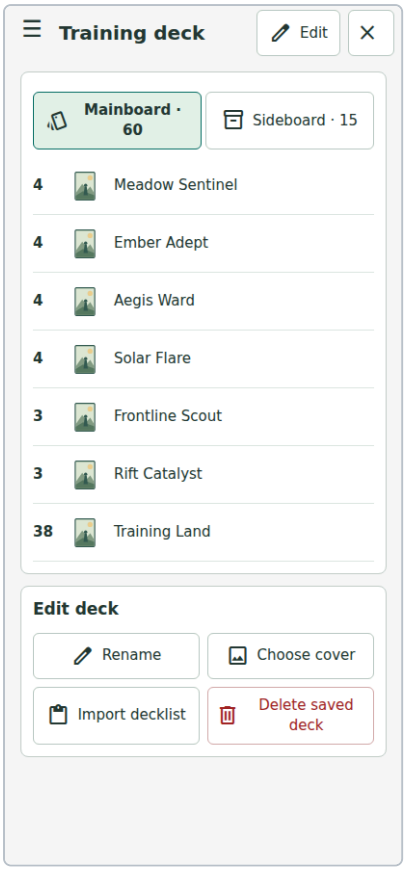

D01 landscape — deck collection layout

Layout: named deck rows/cards use cover placeholders and descriptive mainboard/sideboard counts. Import deck is a labeled text action with a supporting icon **fixed at the bottom**, below the scrolling list, not above it (D-293). Opening a deck goes to D02. An empty collection keeps Import deck visible.

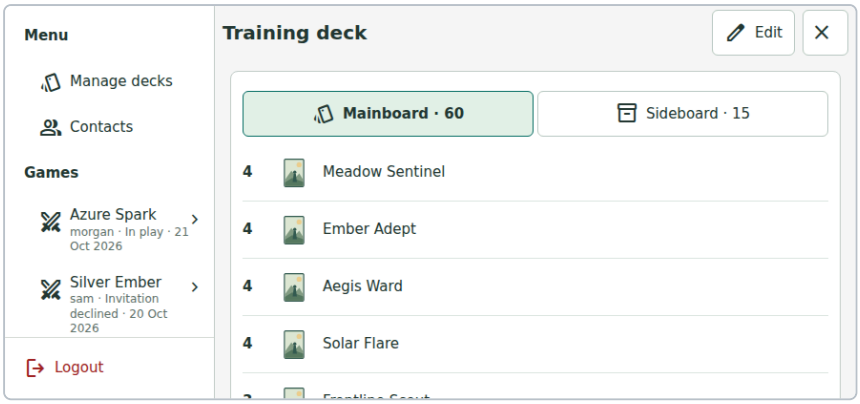

Interaction: collection names/lists/covers synchronize between the account's devices. Saved card-list changes happen through import, not individual quantity editors or a deck-builder search. No Export, legality badge, restore bin, win-rate statistics or gameplay Undo for collection deletion. Missing artwork uses the deck/card text fallback and does not prevent import or deck selection.

Basis: D-189, D-198, D-199, D-218, D-221, D-241, D-271.

D02 — Saved deck details

D02 portrait — metadata actions and read-only card list

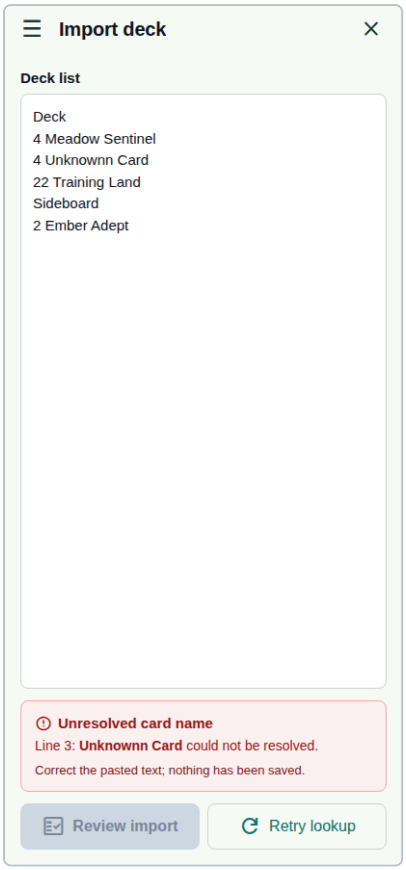

D02 landscape — metadata beside read-only card list

Layout (D-293): quantity → small art thumbnail → card name; a thumbnail/row press opens D08 full inspection. The small visible art has a full-size touch target. Mainboard/Sideboard tabs choose the read-only saved section, not in-game zones. The capture shows **Edit expanded** with Rename, Choose cover, Import decklist and Delete saved deck, all icon + label. This is not a quantity editor/card builder. Title/hamburger, Edit and the right-corner Exit without saving share a row (D-294). Exit discards unfinished input only; it does not undo already accepted metadata.

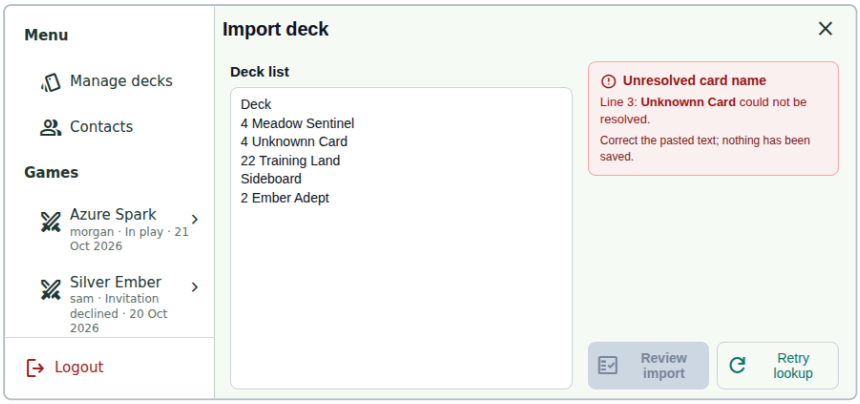

Interaction: proposed Rename opens a small name-field dialog with Save name and Cancel; it cannot change card quantities. Choose cover opens D05. **Edit → Import decklist** opens D07 bound to this deck; Delete opens D06. Saving or deleting this collection entry never rewrites copies already selected in a lobby/game. Card names and counts in the mockup are illustrative synthetic data, not a real valid import or a required deck-size rule.

Basis: D-189, D-199, D-221. Rename's edit state is described but not separately pictured; naming/duplicate policies are not inferred from the example.

D03 — Import with unresolved names

D03 portrait — preserved pasted list and blocking line error

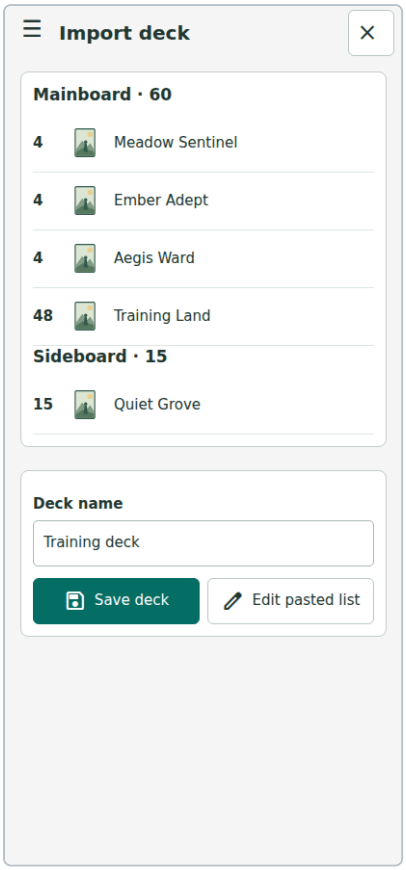

D03 landscape — pasted text beside resolution issues

Layout: Deck list is a multiline text field, not a card builder. The error identifies the unresolved line. Review import is unavailable while entries are unresolved. Landscape uses an input/issues split; input and feedback must both remain reachable rather than squeezing the text area into a one-line field. The title is visible in **both orientations**, aligned with hamburger; Exit without saving is at the far right. The action pair fills its row equally (D-294).

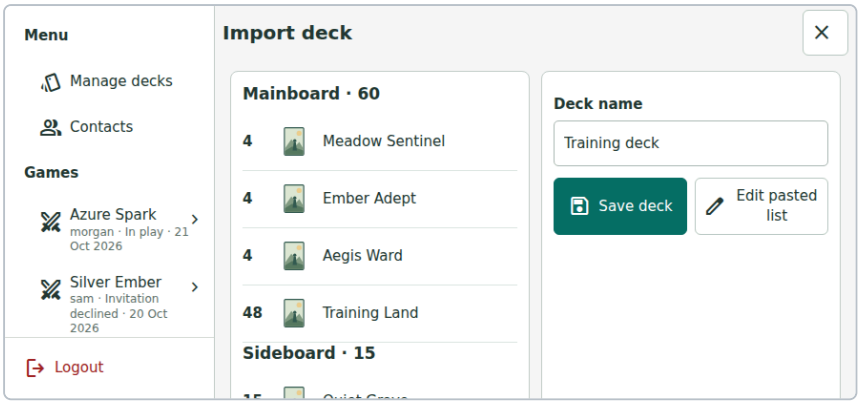

Interaction: accept ordinary quantity/name lists, common optional printing suffixes and supported mainboard/sideboard separators. Correct the pasted text or retry lookup; never silently choose an ambiguous card or save a partial list. Nothing replaces a saved deck on lookup/transport failure. When all entries resolve, Review import advances to D04. Art downloading and obtaining the newest entire catalog are not save prerequisites. No separate Send/definition-upload UI.

Basis: D-198, D-271, D-289. The misspelled synthetic entry deliberately models an error; these fake card names do not claim compatibility with a live catalog. D04 uses a separate complete sample, not the computed count of this short list.

D04 — Resolved new import and save

D04 portrait — resolved new import without arbitrary replacement selector

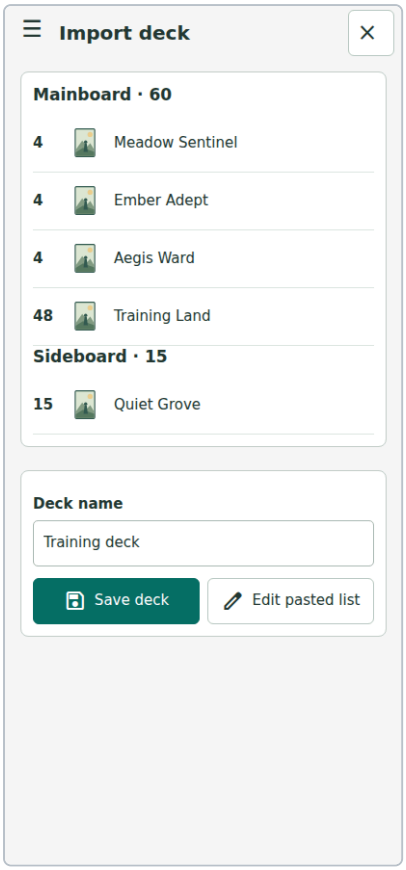

D04 landscape — resolved list beside save controls

Layout (D-293): section counts and read-only art/name/quantity preview accompany a Deck name field. This **new-import** route has no Save-new/Replace selector or existing-deck picker. Save deck and Edit pasted list use icons + labels. Cover selection is optional later metadata, not a forced extra import step. The title/exit row stays above scrolling content in portrait and landscape; the Save/Edit pair fills its panel 50/50. Exit discards the unsaved import, never saves.

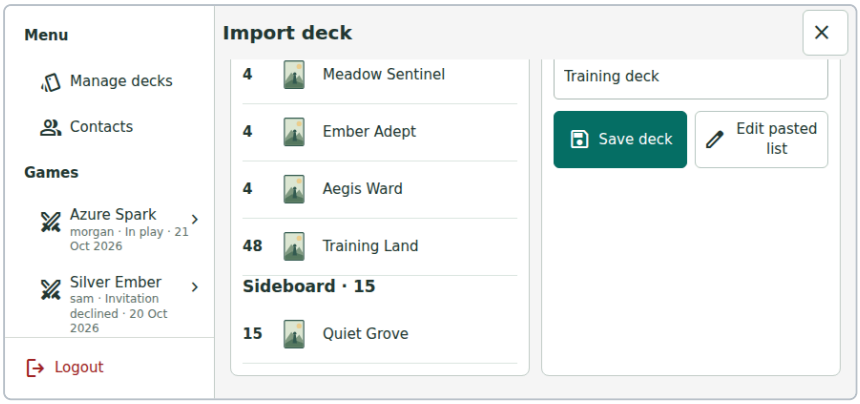

Interaction: Save deck creates a distinct saved entry. Existing-deck updates instead start at D02 Edit → D07 Import decklist, with Overwrite/Merge toggle. Neither route changes a lobby/game's selected copy. Save requires fully resolved definitions and atomic server acceptance; failure retains the previous valid saved deck and editable input. Success returns to D02 (or the calling lobby deck picker when import was launched there). This ordinary form save is not a gameplay Send gate or proof of format legality.

Basis: D-198, D-199, D-221, D-271, D-289. The two-step input/review presentation is proposed and can be simplified during owner review.

D04b — Import review: save controls

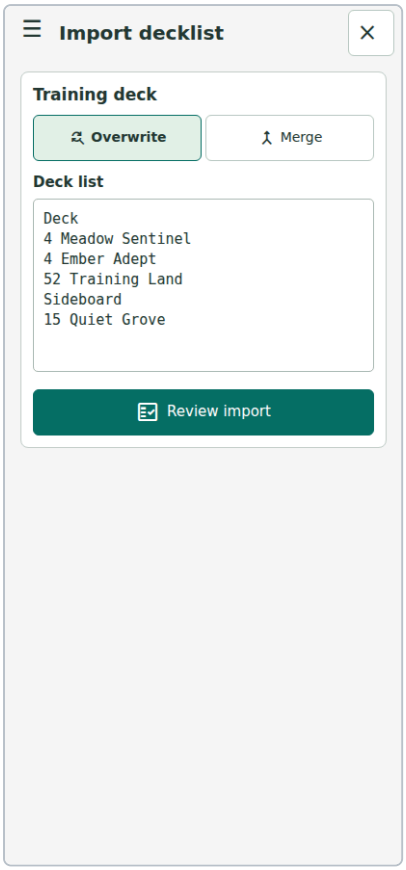

D04b portrait — import review scrolled to save actions

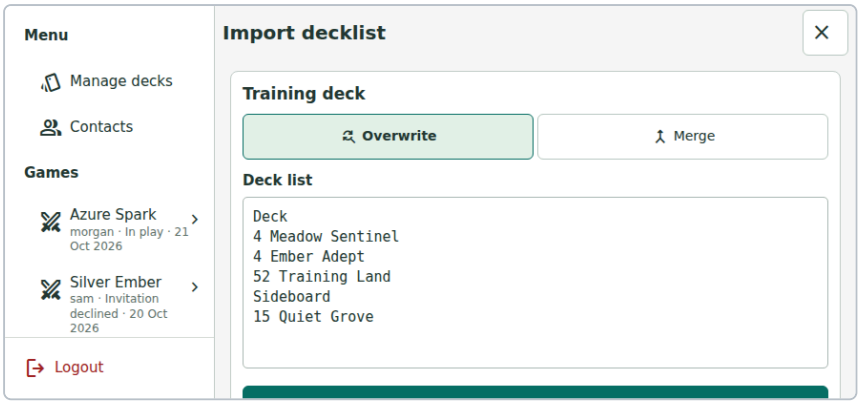

D04b landscape — right-hand save panel scrolled to its actions

Same screen, bottom scroll position: retain this continuation to check D04's actions after content scrolling; short content may already fit. There is no generic replacement selector. Existing-deck import is D07, not a required extra new-import step or Send/upload action. No target shrinks to fit.

D07 — Edit → Import decklist

D07 portrait — contextual import with Overwrite selected by default

D07 landscape — bound deck target and compact Overwrite/Merge toggle

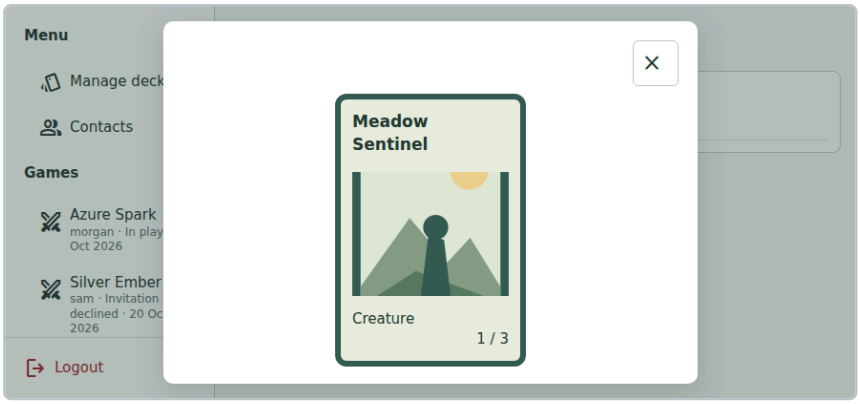

Confirmed (D-293): reach this through D02 **Edit → Import decklist**. The deck target is already known and named; there is no generic “replace which deck?” picker. A fresh invocation defaults to **Overwrite**. **Merge adds quantities** within each section: existing 4 + imported 2 = 6, untouched cards remain, new cards are added. Mainboard and Sideboard stay separate. An omitted sideboard becomes empty on Overwrite and stays intact on Merge. These rules follow the owner’s additive answer, not a maximum-count/set-union interpretation.

Review import resolves every entry before showing the resulting list and Save deck. That contextual review retains the target/mode and previews the **result**, not just the incoming delta. Invalid input/failure leaves the prior saved deck unchanged; server serialization/dedup prevents double Merge on retry. Save updates only this collection entry; selected lobby/game copies survive. Cancel/Back leaves without saving. Mode explanation belongs in these notes/accessibility help, not a permanent paragraph beside an otherwise self-explanatory toggle. Resolution/save error and Merge-result previews are described, not separately captured in this round.

D08 — Full card/art inspection

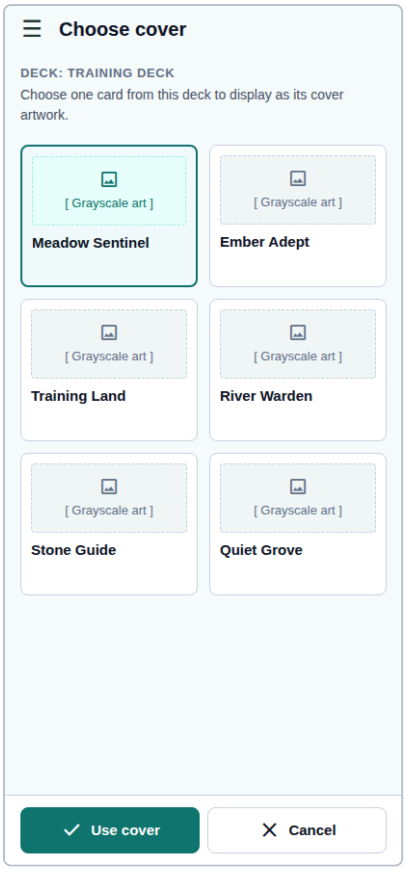

D08 portrait — full card opened from the small deck-row art thumbnail

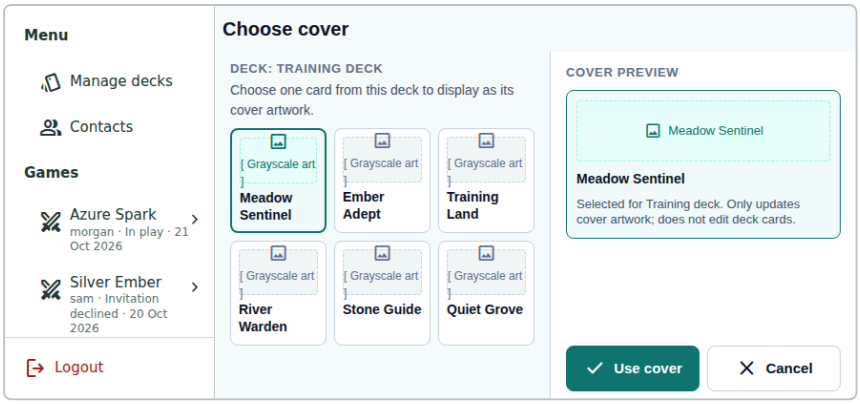

D08 landscape — scrollable full-card inspector

Confirmed direction (D-293): press the art thumbnail immediately after quantity, or the card row, to open full inspection with the same card/art presentation used during gameplay. Close/native Back dismisses without changing the deck, preparation or history. Thumbnail art is visually small but its independent target remains 48 × 48; a row action provides a larger alternative. Synthetic locally authored art stands in for lazy provider artwork; missing art falls back to card name/text without blocking inspection, import or Ready. This is a presentation reference, not an approved card-face style, full gesture implementation or permission to ignore gameplay hidden-face/disclosure rules. Full card text, faces, image failure, zoom/large-text and gameplay-specific states still need their own visual checks.

D05 — Choose a deck cover

D05 portrait — cover choice restricted to this deck

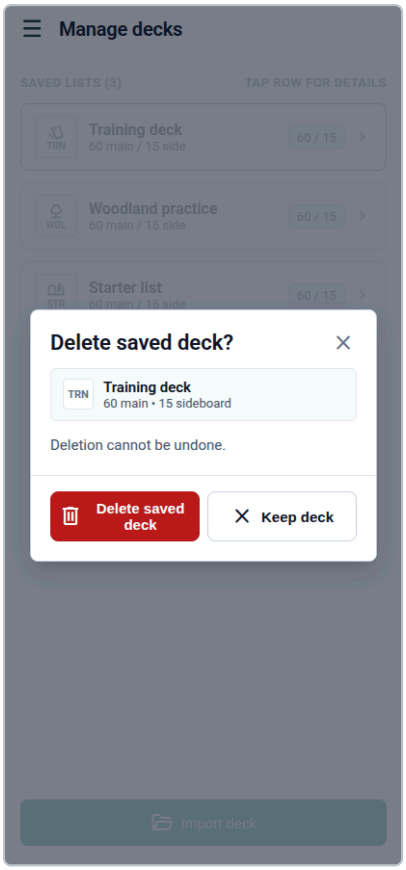

D05 landscape — cover grid with selection preview

Layout: card-name tiles are selectable thumbnails, not card-edit controls. The selected tile has a **border only**, no additional checkbox/checkmark (D-294); native selected semantics and its card name remain. **Use cover** confirms the metadata choice; Cancel/Back leaves it unchanged. Landscape uses the short width efficiently while allowing the grid to scroll.

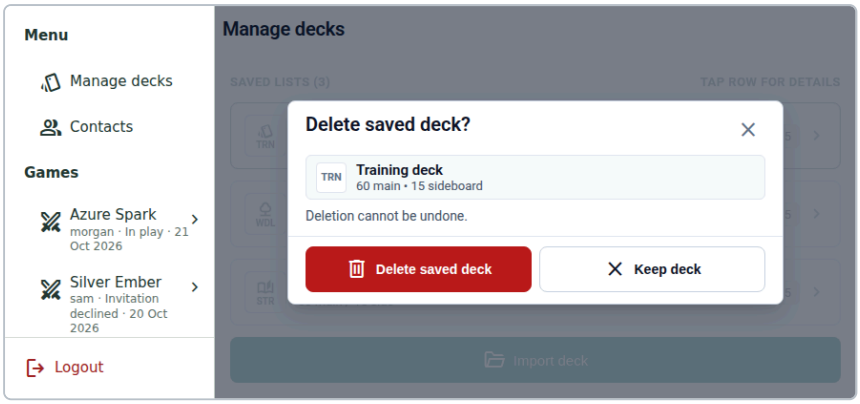

Interaction: select one card already in this deck as its cover. No image upload, crop tool, outside-catalog cover choice or mutation of that card. Text fallback remains available while art is absent. The small selection/confirmation step is a reviewable UI proposal, not a new game-action confirmation requirement. Cover fallback after a later re-import is not decided by these example tiles.

Basis: D-199, D-271.

D06 — Delete a saved deck

D06 portrait — delete confirmation over deck collection

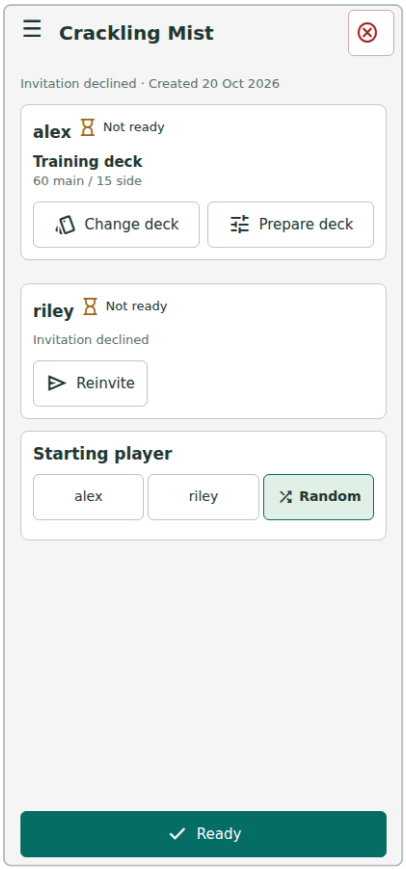

D06 landscape — bounded delete confirmation

Layout: a bounded modal over the collection, with Keep deck and Delete saved deck as text buttons. The destructive button is distinguished by wording as well as styling. Background rows are not interactive while the modal is open. **D-294:** close X is top-right, actions are equal-width, and the explanation is only **“Deletion cannot be undone.”** The longer copy-isolation/no-trash paragraphs are removed from the dialog, not from the behavior contract.

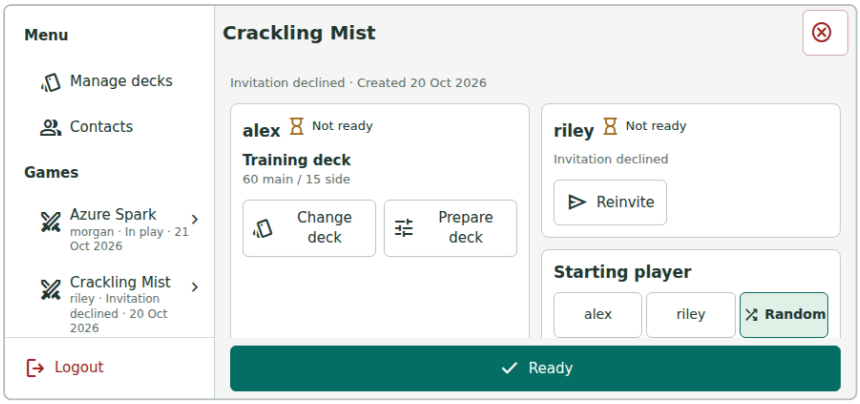

Interaction: Keep deck/Back cancels this dialog without deleting anything. Delete saved deck requests collection deletion and returns to D01 after success. Selected game/lobby copies survive. No trash folder, gameplay Undo or misleading “Undo deletion” snackbar is offered. A failed deletion reports its actual failure without optimistically claiming permanent success. This one destructive-data confirmation is a proposal, not a universal confirm-every-action policy.

Basis: D-221, D-241; exact confirmation presentation is UI design work.

L01 — Retained inviter lobby after decline

L01 portrait — retained inviter preparation and contextual Reinvite after decline

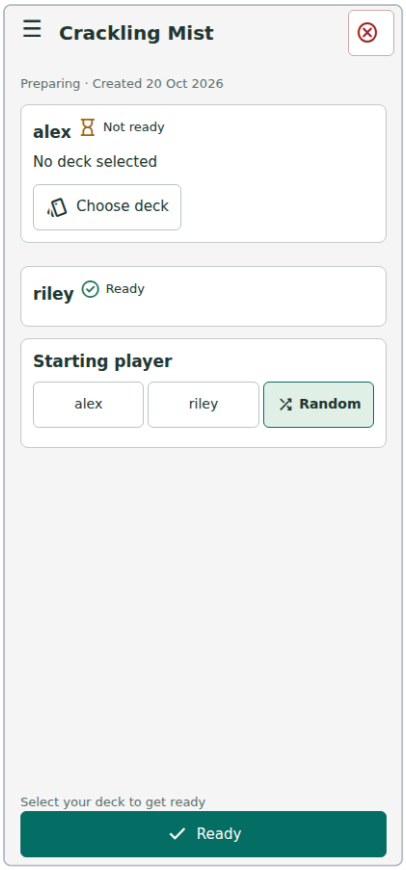

L01 landscape — own preparation beside declined status and Reinvite

Layout: own deck/preparation, recipient invitation status, starter choice and Ready are distinct. Ready is enabled because this example has an own selected deck, even though riley has not accepted. D-293 now pictures the retained **declined** state with Reinvite inside this same lobby. The pending variant omits Reinvite and says Invitation pending; it is not a separate game. Cancel game is separate from Back. Random is an illustrative selected value, not an approved universal default. **D-294 layout:** game name **Crackling Mist** is the title; state/creation date appear beneath. Hamburger shares the title row and Cancel is its top-right control. Reinvite is **inside riley's opponent slot**, not the footer. Ready alone fills the bottom; there is no leaving-lobby helper. No Back/home arrow.

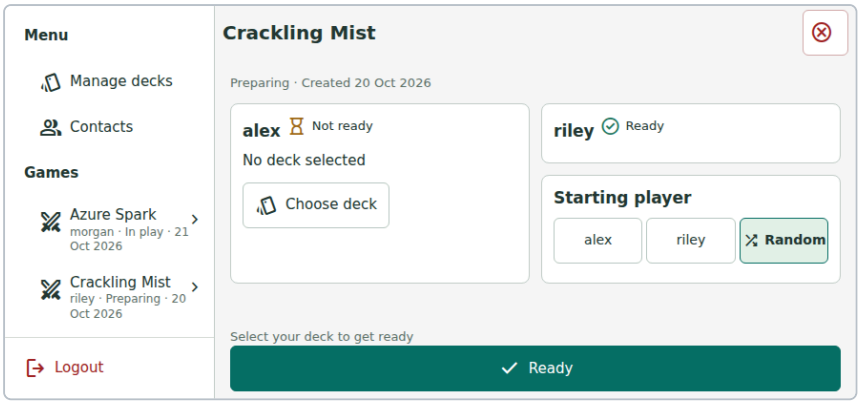

Interaction: Change deck opens L03; Prepare deck opens L04. Ready can persist before acceptance. The opponent's later acceptance opens this same lobby without resetting the inviter's preparation or Ready. Decline retains it and permits Reinvite through the existing-lobby path. Cancel game removes this pending invite and its game; merely leaving the screen does neither. No host Start or expiry.

Basis: D-195, D-201, D-204–D-209, D-287.

L02 — Accepted lobby before own deck selection

L02 portrait — choose own deck before Ready

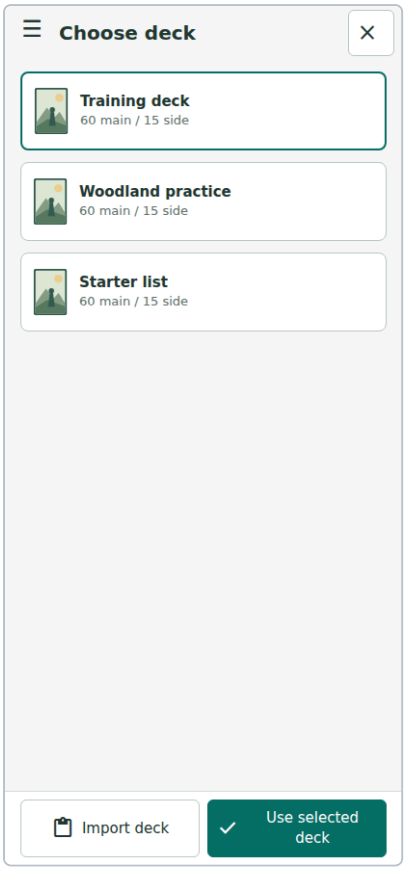

L02 landscape — own preparation and opponent Ready

Layout: Choose deck is the own-side primary action. Opponent Ready is an explicit status with text/checkmark, not permission to start for them. Own Ready is disabled with the visible reason “Select your deck.” Starter offers either participant or Random; it is not a pre-start reroll. Game-name title, creation date beside state, title-row Cancel and helper-free bottom Ready follow L01/D-294. The visible disabled-Ready reason is retained.

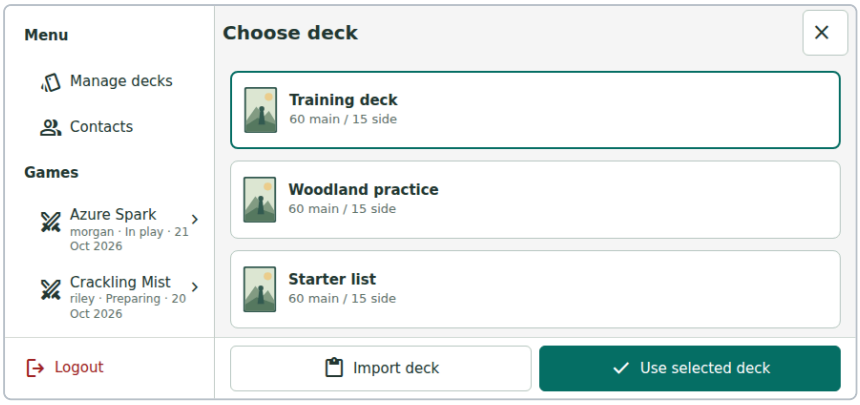

Interaction: Accepting P01 did not select a deck, Ready or immediately start. Select an existing saved deck through L03; no legality or size check is added. After selection, Prepare deck and enabled Ready use L01/L05’s layout with accepted opponent status. Changes to own deck/preparation/starter clear only the changing player’s Ready. Late lobby edits after the game starts fail normally; the screen must move to the actual active game rather than reopening the lobby.

Basis: D-190, D-191, D-195, D-201, D-204, D-205, D-274.

L03 — Select a game-local deck copy

L03 portrait — saved deck choices for this game

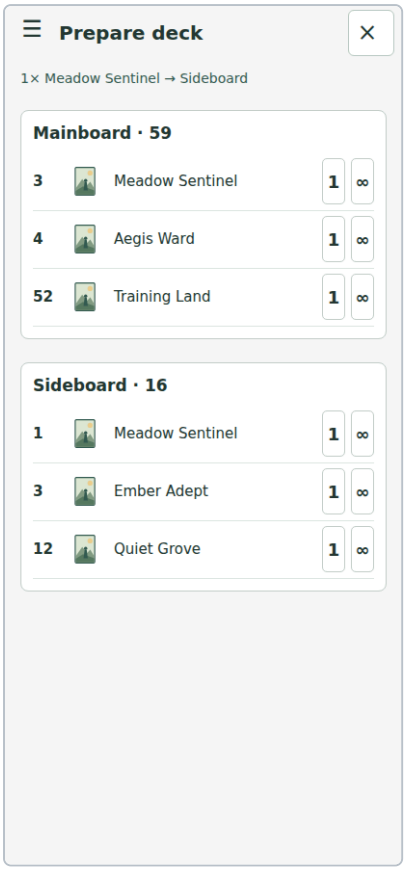

L03 landscape — deck-selection grid

Layout (D-294): named deck rows with cover/counts use a **selection border**, no per-row Select buttons or checkboxes. The image shows a personal row selection already made, not an automatic first-deck default. One **Use selected deck** confirmation is fixed at the bottom beside bottom Import (equal widths).

Interaction: highlighting rows is personal draft UI; no prepared-copy request or Ready clearing occurs yet. **Use selected deck** submits the chosen copy and returns to lobby; no valid chosen source means confirmation is unavailable. Acceptance clears own Ready without affecting the opponent's. It does not edit the saved source, auto-ready or require another Send/confirmation after this bottom confirmation. A stale/deleted source or started round fails normally, not a substitute deck or a new lobby. Deleting/editing the source later leaves this copy intact. Back cancels the picker without changing selection. An empty collection uses the same Import route; there is no automatic blank deck or silent substitute.

Basis: D-189, D-191, D-199, D-205, D-221.

L04 — Prepare mainboard and sideboard

L04 portrait — lobby-only mainboard and sideboard panels

L04 landscape — preparation lists side by side

Layout (D-293/D-294 follow-ups): Mainboard and Sideboard are separate panels. Every quantity/art/name row has **two compact 24 px-wide tap buttons/drag origins**: **1** for one copy and ∞ for all copies. D-294 removes the separate grip, prioritizing scope and card-name space. Tap moves directly to the other section; drag remains available. No select-row-then-Move-button bar. Portrait stacks panels; landscape uses columns; long content scrolls. Ordinary buttons stay 48 px; the explicitly compact one/all controls are an explicit exception with accessible alternatives, not overlapping invisible targets. A **40 px plain-text feedback slot is always reserved** below the title. The picture shows the latest move and resulting 59/16 counts.

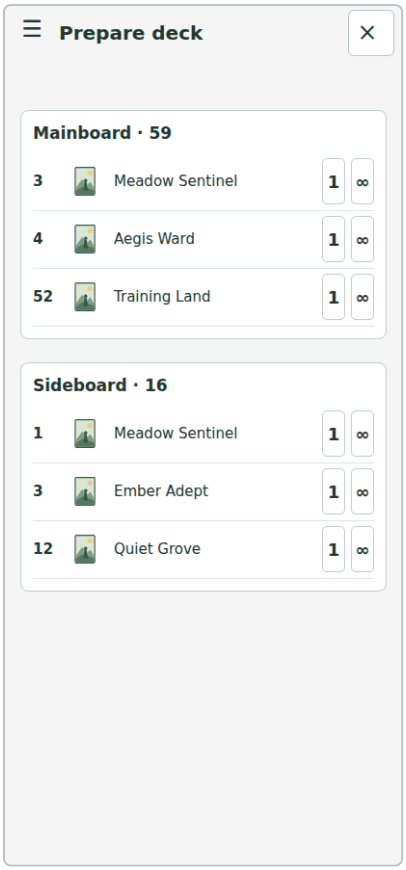

Interaction: tap **1 / ∞** to move one/all copies to the other section, or drag that same control to it. A recognized drag suppresses tap; control input must not also open the inspector. Bind copies/identity at gesture start, not a changing row index; all excludes later arrivals. No one-for-one/size enforcement. Cancel/outside drop sends nothing. Transfers emit ordinary per-card preparation requests, not per-frame writes or a new atomic bulk transaction. Show actual partial outcomes under normal guards. Native accessibility provides equivalent one/all actions. Press the thumbnail/row instead to inspect; the small count controls transfer. Completed transfers automatically synchronize, clear only own Ready and leave the saved deck alone. No Save preparation/Done-to-send is required. Back simply returns to the lobby. On entering actual play, no Sideboard view/edit/move path exists. The shown handle glyphs/drag feedback remain visual proposals, not a change to transfer scope.

Latest-move feedback (F35): e.g. **1× Meadow Sentinel → Sideboard**, fading over about **1–2 seconds** (1.5 s proposed). New moves replace/restart the message. Opacity changes never collapse/insert its space or move any headers/lists/buttons. Show the actually displayed transfer promptly under normal provisional application; it is not a server receipt. Correct partial/rejected outcomes normally, never delay input for acknowledgement/animation or claim a move that did not occur.

Disappearing rows (F36): when a tap removes the last displayed copies, quickly fade out that row while following rows slide upward into its space. A ~150–220 ms combined transition is a timing proposal, not an exact approved interval. This intentional transfer-driven list reflow is distinct from the fixed feedback slot. Quantity-only changes retain their row. A fading visual ghost is not counted or actionable game state; requests/count updates never wait for it. Rapid transfers/ reconciliation retarget current drawn geometry, never another row sliding under a captured finger. Native reduced-motion/accessibility must retain clear identity/ feedback. These inert snapshots do **not** demonstrate an implemented animation.

Basis: D-189, D-191, D-202, D-203, D-259.

L04b — Latest-transfer text faded, layout unchanged

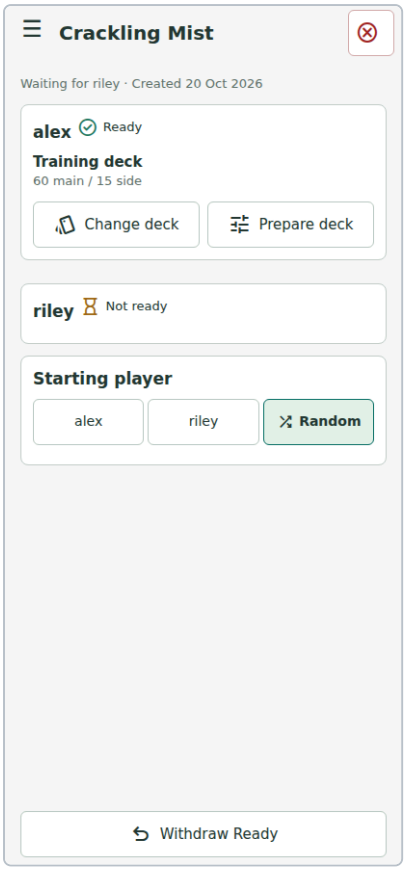

L04b portrait — same preparation state with the feedback text faded

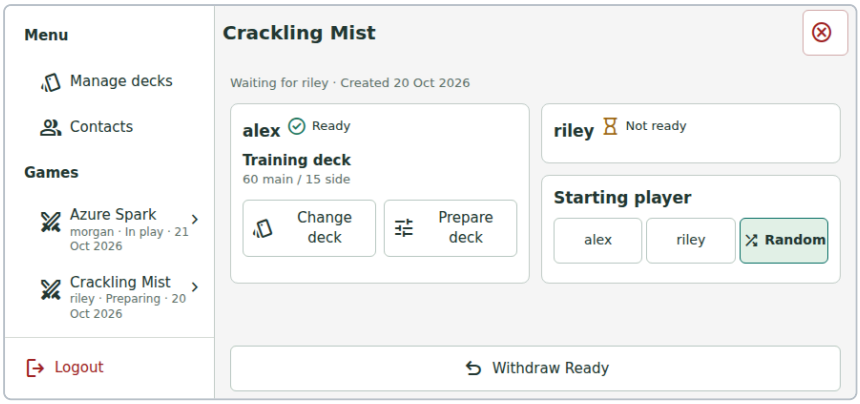

L04b landscape — fixed feedback slot retains identical list geometry

Same preparation state as L04: only the feedback opacity changes. The slot, title, lists and controls keep exactly the same geometry. Captures freeze visible/ faded endpoints for review; the native app must fade over ~1–2 s. This is not a new transfer, delayed publication or empty spacer added only after a tap. The separate short disappearing-row transition is specified in L04, not functioning in this static document. No extra app route or tap is required to reach this state.

L05 — Own Ready accepted

L05 portrait — own Ready and waiting for the opponent

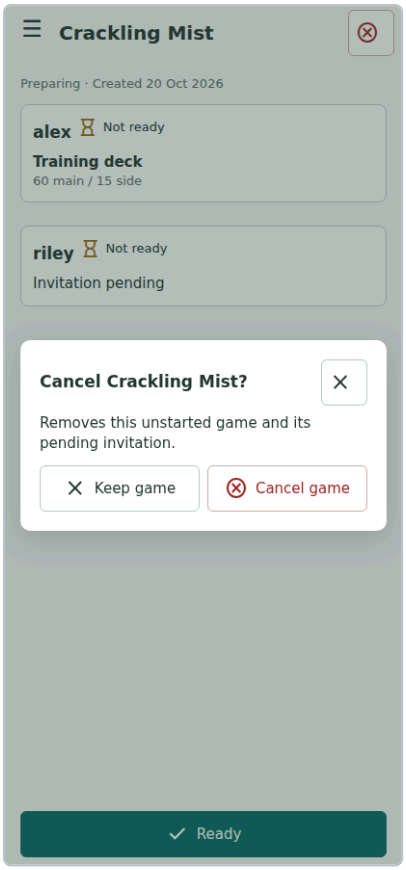

L05 landscape — Ready status and setup controls

Layout: own Ready is a textual status/checkmark. Withdraw Ready is an explicit action; Change deck/Prepare deck remain discoverable. No host Start button or both-online indicator. Cancel game remains separate and applies only before start. **D-294:** game-name title, creation-date/state details and upper-right Cancel; Withdraw Ready fills the bottom, with no explanation about leaving below it.

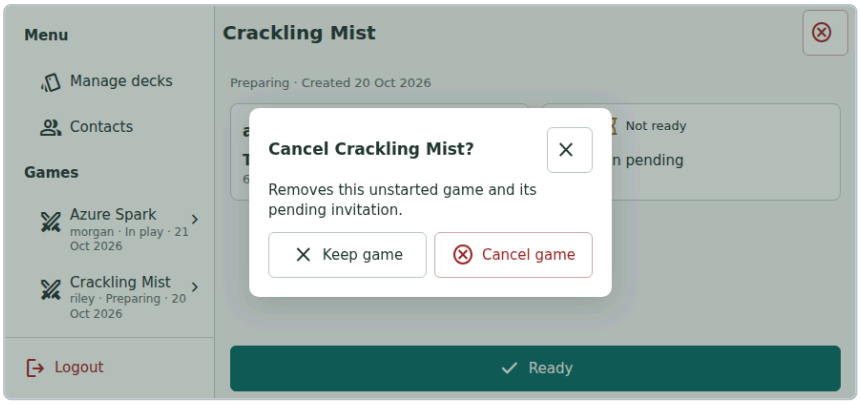

Interaction: Ready persists after leaving/disconnection; it is not a liveness lease. The second accepted Ready starts once, even while the first player is away. Start shuffles both Libraries, sets life to 20, resolves a selected Random starter and begins turn 1 at Untap, with **no automatic opening draw**. The extended packet then uses G01. On returning after an accepted game ending, restore last prepared decks, clear both Ready and use this lobby structure in its not-ready state; both must ready again. Back alone never withdraws Ready or cancels the game.

Basis: D-190, D-200, D-204, D-205, D-213, D-274.

L06 — Cancel an unstarted game

L06 portrait — explicit lobby-cancellation dialog

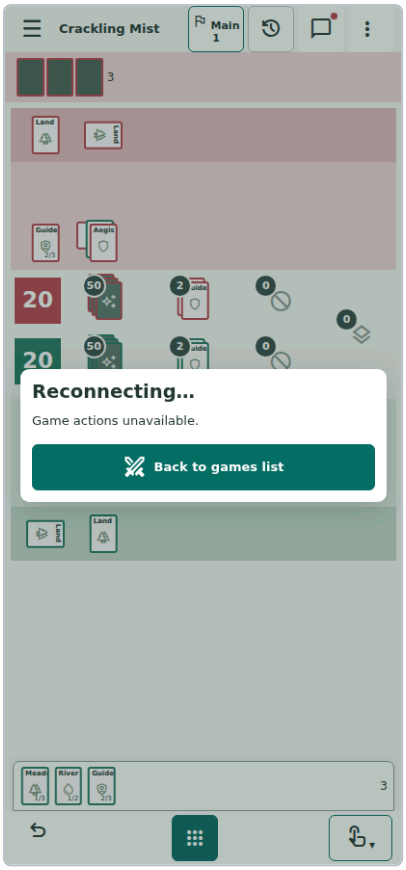

L06 landscape — bounded lobby-cancellation dialog

Layout: proposed confirmation with Keep game / Cancel game text buttons. The dimmed background is a lobby, not a live game. Back/close keeps the game.

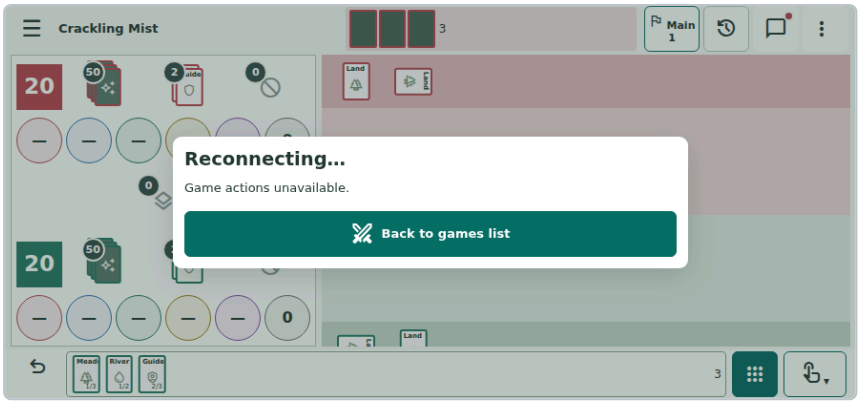

Interaction: either participant can request cancellation before start without the other player's approval. It removes the current listing and pending invite; there is no trash/restore UI. Leaving the screen is different and preserves the lobby/Ready. If start already won the normal server ordering race, do not cancel or reset that started play; show the current game. Reinvitation must not revive a cancelled lobby. This dialog is not the gameplay result-suggestion/acceptance flow, which is intentionally excluded from the pilot.

Basis: D-205–D-209, D-241, D-287. The extra cancellation confirmation is a reviewable UI proposal, not approval of an extra gameplay-ending confirmation.

U01 — Reconnecting and return to games

U01 portrait — reconnecting modal over the actual table layout

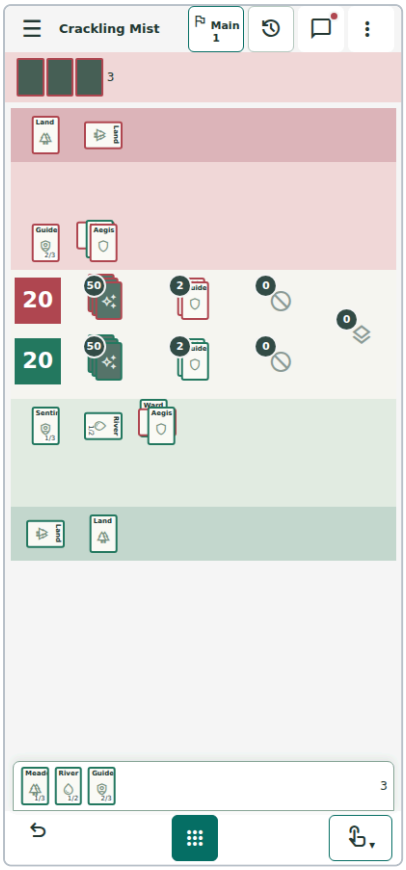

U01 landscape — reconnecting with games-list escape only

Layout (D-295): Reconnecting is a status dialog over a **real table**, not the old empty pilot area. Its only button is **Back to games list**, icon plus text; no Review downloaded data action or duplicate recovery explanation. Reconnection continues automatically; returning to the list does not cancel already-sent work.

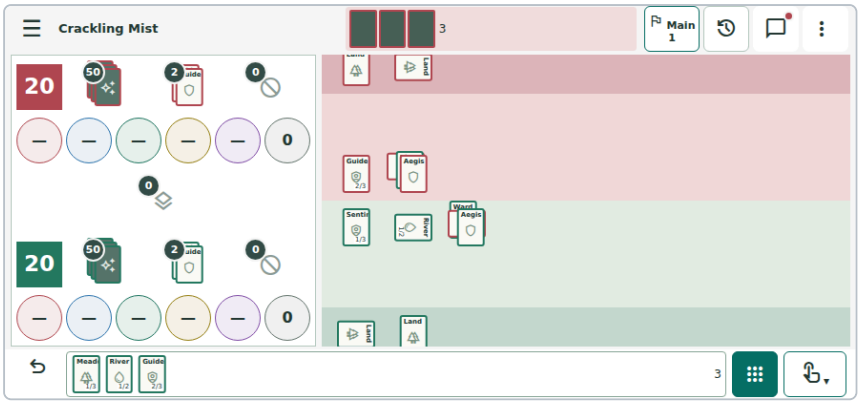

Interaction: shared actions stay blocked while disconnected, including Undo, Ready, branch activation and new inspection requiring exposure logging. Downloaded read-only navigation remains available. This does not create offline actions or a manual-resend/recovery-center workflow. Same-process reconnect automatically recovers actual already-sent outcomes with original identities. Process restart instead syncs server state and may lose uncommitted local work. Unknown outcome is not rejection; the UI must not invite duplicate submission as a fresh action.

Basis: D-182, D-215, D-216, D-241, D-246, D-252, D-278 and D-295. The table backdrop is a local inert derivative, not functioning offline gameplay or a passed reconnect/accessibility test.

G01 — Live table and fixed hand

G01 portrait — own green/opponent red bands, middle special zones and fixed own Hand

G01 landscape — both players' special zones on the left and floating own Hand

Layout: own battlefield below, opponent above, reflected top/bottom while retaining x positions. Each has an outer darker one-row band and inner lighter two-row band. These are **one generic battlefield per player**, not new land/ creature zones or type restrictions. All faces point toward the viewer; only ordinary tapped cards rotate. **D-295:** own bands are green, opponent bands red; there are no visible empty slots, battlefield row separators or area labels. Logical snapping remains. Every card or ordinary pile has the **same horizontal footprint**, containing its entire upright/tapped/mixed-pile envelope; rotating or stacking does not change adjacent anchor spacing. The camera can pan beyond occupied columns by a still-unspecified margin.

Borders identify **owner**, not location/controller or permissions. Own and opponent colors remain on cards/tokens even on the opposite field; projections derive their live source's owner. Creator/bringer is the default owner; Change owner is explicit shared gameplay (G04/G06). P/T sits at the card's bottom-right. Life is only a player-colored square with the number, without printed names or "Life" text; accessible descriptions retain participant identity and meaning. **D-296:** tap it for life/player-counter actions (G07). Counter rows sit below special piles; portrait shows each player's row only when at least one counter is nonempty/nonzero. Hiding a row never deletes zero values or removes menu access.

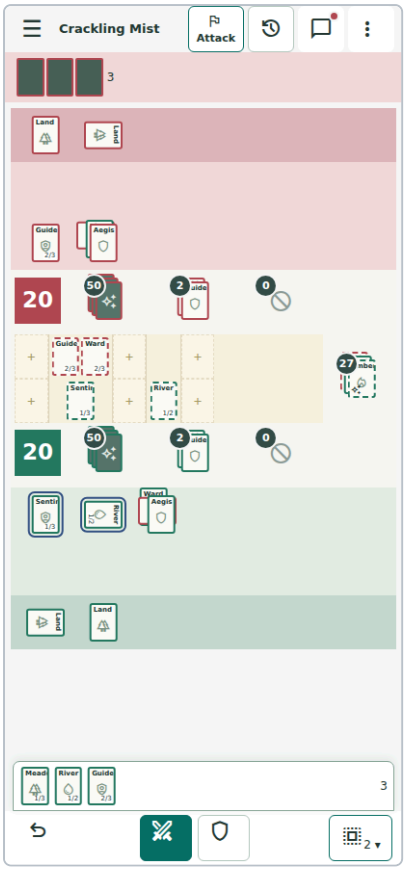

Fixed versus movable: in portrait the owner's Hand hovers below the land band above bottom controls, independent of board panning. **D-297:** landscape own Hand shares the bottom row with quick actions; the proposed covered opponent Hand moves into the existing top control row, so neither hand covers the battlefield or takes its vertical space. Portrait opponent Hand remains a covered top row. Both hands use compact gaps and left/right pan when they overflow (G10), without changing card scale, order, privacy or dispatching a move from navigation. Both players' Library/Graveyard/Exile counts and proposed life grouping occupy the central strip in portrait, a **left** sidebar in landscape. Fixed dock anchors do not become shared placement. **D-296:** every card drawing uses the same current zoom, across battlefield, combat, Stack, hands/backs, reveals and special piles. These captures use **one 40 px card height**, in both orientations and every area, not a selected final native minimum. There is no row-height/zone-dependent shrinking. Landscape deliberately pans the table to a middle framing; the full-height board remains navigable rather than being squeezed into its viewport. Landscape hands occupy the existing top/bottom rows, clear of field and history timeline; transport remains reachable. Dense/hit geometry still needs device review. Visible player counter circles spread evenly over the whole row (D-297), preserving the portrait visibility predicate.

Controls: bottom-left tap Undo / hold Redo; bottom-center contextual actions; bottom-right current mode. The proposed mode square opens explicit Normal / Select / Ping choices. Select toggles membership editing without clearing the selection when turned off; Ping consumes its taps. Phase tap opens the existing tracking picker, not an automatic game action. History opens personal review. Overflow exposes Redo and full Game actions; a **separate Chat button** opens G09, with an unread bubble when incoming messages remain unviewed. A generic Actions affordance does not invent a phase shortcut or remove the full per-card action paths.

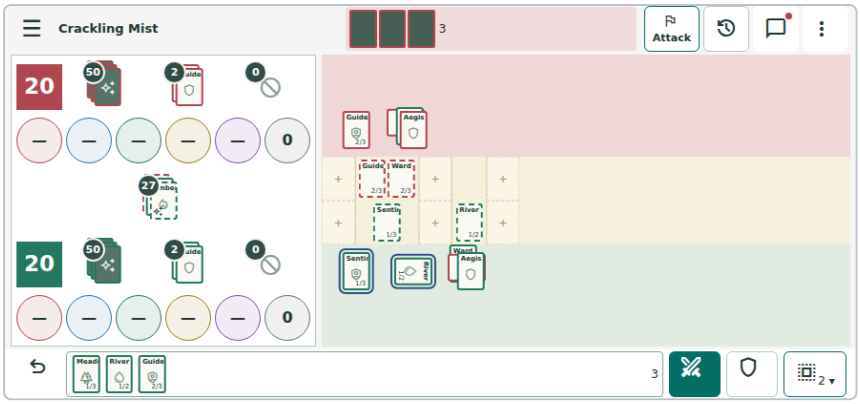

Gestures: normal single tap opens captured-scope card Actions; double tap performs one selection-aware tap/untap. Hold inspects; drag moves the captured card/selection. Empty-space drag selects; two-finger pan/pinch navigates. These are documented interactions, **not functioning gestures in these static files**. Own/opponent hidden-face rules remain unchanged. No in-game Sideboard, Send, presence, turn lock or inferred card rules.

Basis: D-267/D-281, D-259, D-291 and D-295/D-296; board/inspection contracts. Exact life placement, top Hand and control shapes remain review proposals.

G02 — Live combat and populated Stack

G02 portrait — central Stack and paired combat projections with sources retained

G02 landscape — dense central lanes with fixed controls retained

Layout (D-295): portrait Stack sits to the right of the central Library controls. The trial places combat **between** the opponent/own library rows, with Stack beside it; this combat placement remains tentative. Combat pairs alone have faint vertical dividers, with blockers above attackers; real sources remain on their battlefields. Dashed owner-colored borders distinguish projections from real cards.

D-296 landscape supersession: Stack is in the **left side panel between player-info blocks**, not beside central combat. Combat cards use exactly the same card size as all other areas at this zoom. Portrait placement is retained.

D-297: pairs no longer stretch equally across the combat row: each fits the wider attacker/blocker side plus tiny margins. The example's first pair has two blockers and one attacker; the second is attacker-only. One-card-width empty insertion targets remain visible before, between and after them, with both sides addressable. An open empty area has one such target. They are drop affordances, not saved empty pairs: merely rendering/cancelling creates nothing, and D-138 still removes fully empty semantic pairs. A valid drag creates/reuses/inserts only the requested occurrences, never moves their real battlefield sources. Pan for more pairs; no equal-width stretching or smaller combat cards.

Stack uses the same **diagonal corner-peek** presentation as ordinary piles, but has **no gameplay item-count capacity**: show the top card plus at most two below it, never a horizontal sequence of all entries. The pictured **27** is the full mixed actual-card/projection count, not three items. Its contents action exposes all entries in existing order, without dropping/reordering or conflating source and occurrence actions. This is a rendering bound, not the ordinary visual-pile membership limit, a new resolution rule or a promise of infinite memory.

The total **27** now appears in the same **top-left circular badge** as Library, Graveyard and Exile, not a second count button below the pile. The whole pile/ badge affordance opens retained contents; counts do not reveal covered faces.

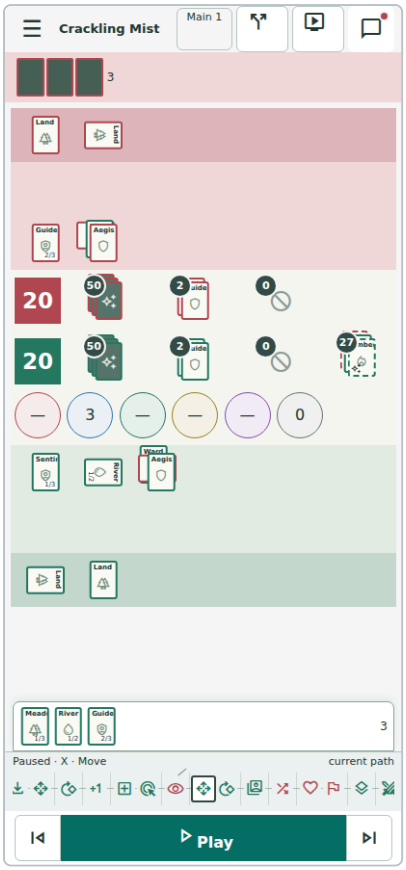

Actions: during Declare attackers with a selection, offer Declare + tap / Without tap. The first composes occurrence entry and individual source taps; the second preserves source orientation. The center quick-action strip can scroll horizontally without moving Undo/mode controls. Full constituent paths remain available outside

the quick window. Neither rendering this state nor entering a phase declares attackers, closes combat, resolves Stack or calculates damage.

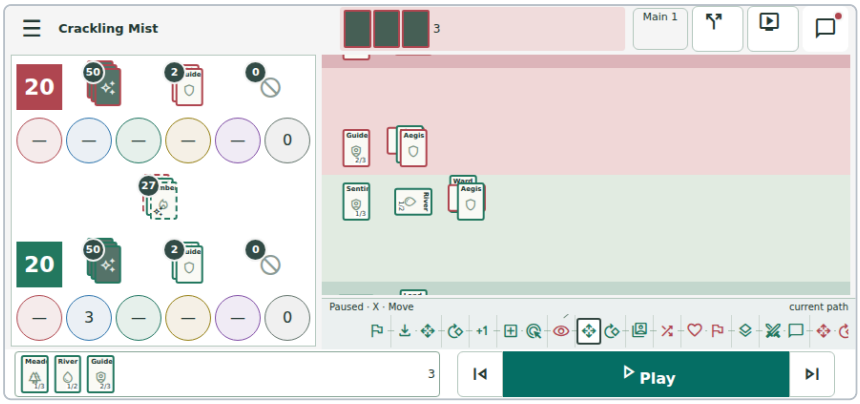

Combat persists until explicit closure, including when empty. Ordinary phase advancement does not close it. Moving a source out of Battlefield cleans up its combat occurrences, not its independent Stack effects. Card-directed edits through live projections affect the real source; occurrence removal is separate. Dense combat may need board navigation rather than smaller fixed controls. Empty/open, many-pair and frozen-token-effect visuals remain further review states.

Basis: D-112–D-158, D-176, D-242/D-253 and D-291.

H01 — Historical review paused at an exact event

H01 portrait — paused timeline selecting exact mutation X and separate continuation action

H01 landscape — read-only historical table with group transport and exact cursor

Layout: the table/Hand show the selected historical boundary. Live editing chrome is replaced with Previous / Play / Next at the bottom, and the path timeline immediately above. **D-295:** dense 24 px event pitch replaces four widely spaced dots; the node itself is its type icon. Different types have distinct icons, repeated types reuse theirs. Selection outlines the icon without replacing it. The strip scrolls/scrubs a window of the path, not a capped/aggregated event list; accessible event details identify exact boundary, type, author and outcome. **D-296:** icons use originating-player color, independent of the affected card's owner. Faint vertical dividers mark effective group changes (not every event). Selection outlines the icon without replacing its type or author color. The exact X marker can lie inside a playback group. **D-297:** that marker is **always at the timeline viewport's exact center**. The selection square stays still while the path slides under it during scrub, Previous/Next and playback. At the first/last event the unused half stays empty, not edge-clamped or filled with invented events/line. H04/H05 show endpoints; one-event paths leave both halves empty. Resize/fallback recenters the actual selected boundary, without choosing a different event to fill the strip. Diagonal branch stubs indicate retained alternatives, not a full expanded tree. Off-path navigation needs a further branch-selection view; a stub is not itself permission to activate, archive or delete anything.

Interaction: Previous/Next navigate groups; timeline drag selects individual mutation boundaries and updates the board during the drag. Board animation uses the displayed-to-selected endpoint, not a compulsory queue of every passed node. Phase is read-only; gameplay edits, Undo/Redo, quick actions and mode input are hidden. Permitted local inspection/navigation remains, but a hidden-information request is not silently issued by browsing. Sync continues while paused, with normal deleted-cursor ancestor fallback.

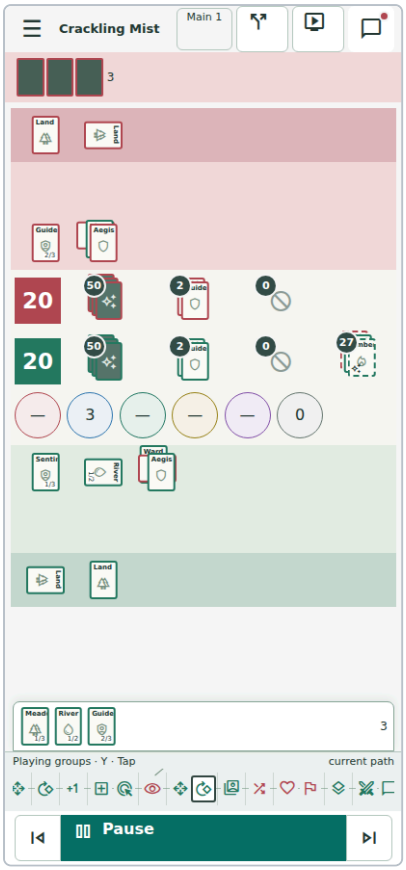

Continue playing from here is distinct from Play. It arms intent at the exact selected event and exposes gameplay controls (H03), without creating a fork. Back to live uses the existing catch-up/changed-path traversal toward the shared continuation, not an unexplained snapshot jump; viewing a branch does not activate it. Offline review never enables this gameplay continuation route.

D-296 transport: Play/Pause has icon **and text** and fills portrait space between Previous/Next. Landscape keeps a similarly prominent center button with Previous/Next attached directly, rather than at screen edges. **Hold Play while paused** to perform the same explicit continuation as the top-corner button. Recognition consumes the tap,

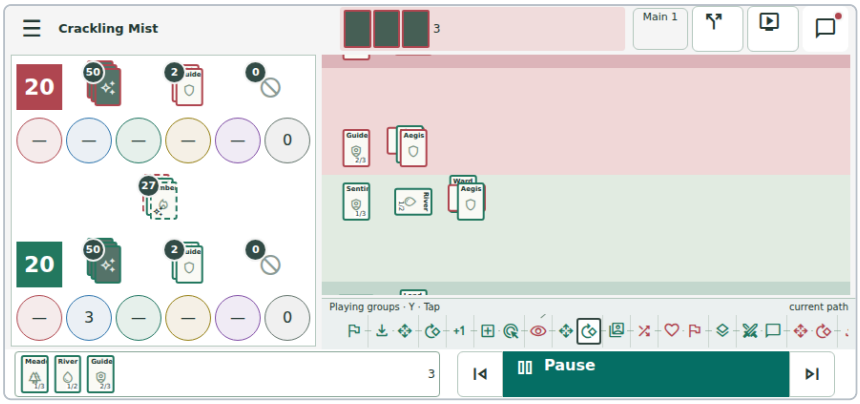

never also starting playback. No tooltip or explanation is printed for this shortcut; the top/accessibility route remains.

Basis: D-177/D-179, D-238/D-245, D-277 and D-291.

H02 — Grouped playback running

H02 portrait — running group playback with Pause and exact timeline marker

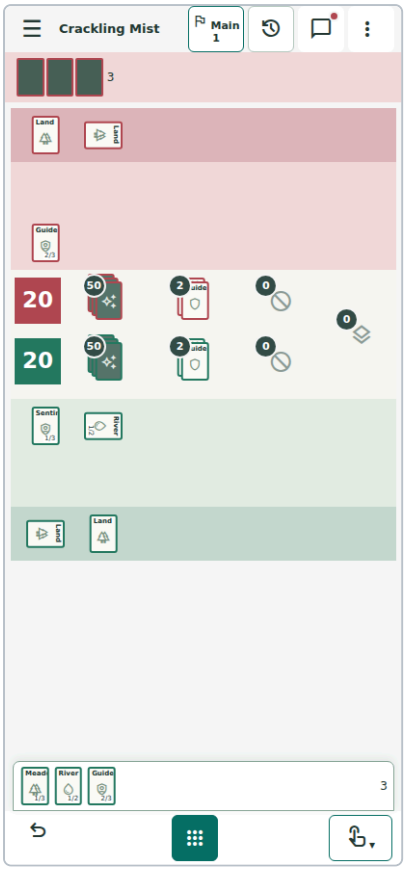

H02 landscape — compact playback controls and pause-on-drag timeline

Interaction: Pause stops personal playback, not server sync. Touching/dragging the timeline **pauses first, then scrubs** exact events. Continue playing from here also pauses at the selected concrete boundary and arms intent; it is not the transport Play action. Each playback group animates its net start-to-end board change; separate groups remain staged even if downloaded together.

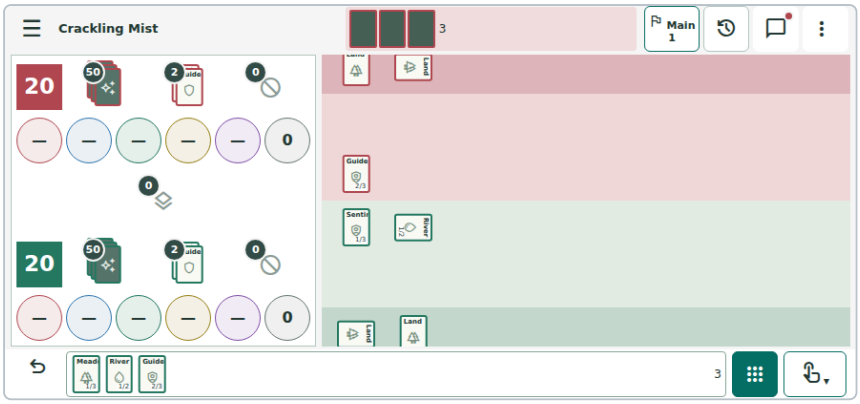

Returning: backgrounded games with unpresented updates enter this playback flow from the last presented/reviewed context. Changed paths retain the specified common-ancestor rollback before catch-up. Reaching the shared live boundary returns to live; an expected own confirmation alone does not manufacture a replay. No autoplay preference, speed default, finished-game archive or animation timing is chosen by this mockup.

Basis: D-177/D-277 and D-291. Historical no-edit chrome matches H01.

H03 — Historical continuation armed before first action

H03 portrait — continuing from A with no mutation or new fork yet

H03 landscape — armed historical intent and restored gameplay controls

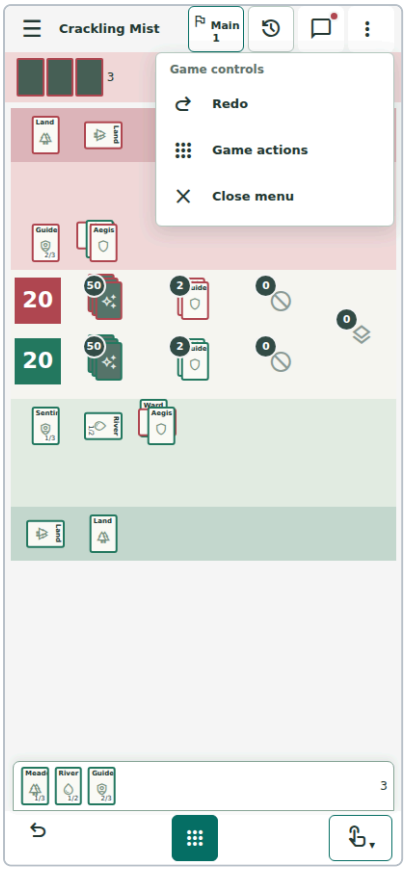

State (D-296): the area looks like ordinary live play **at the selected historical state**, with no Continuing from banner or extra explanation. The example intentionally differs from the head's card arrangement. This is armed personal intent, not a third authoritative game. The old future remains retained and active until a successful explicit continuation mutation creates/activates the new line. Cancel / Return to live before that action only leaves personal intent; there is no empty branch to delete. Failure/no-change likewise does not create one.

Undo clarification: old A → B → C, new A → X → Y: eligible latest-own Undo may remove Y and then X, including the first action immediately after the fork. It leaves the current boundary at A without automatically returning to B→C. The fork point A cannot be undone/crossed while it actually has multiple retained child continuations. Recompute eligibility after each accepted Undo: removing the last action of a new line does not leave a permanent "was once a fork" lock, but the remaining linear future still participates in ordinary replay checks. Author, revealing-action, dependency, replay-work and later-fork checks still apply. This addresses accidental branch creation using the **existing rule**; it is not unconditional cancellation of any action or recall of a sent request.

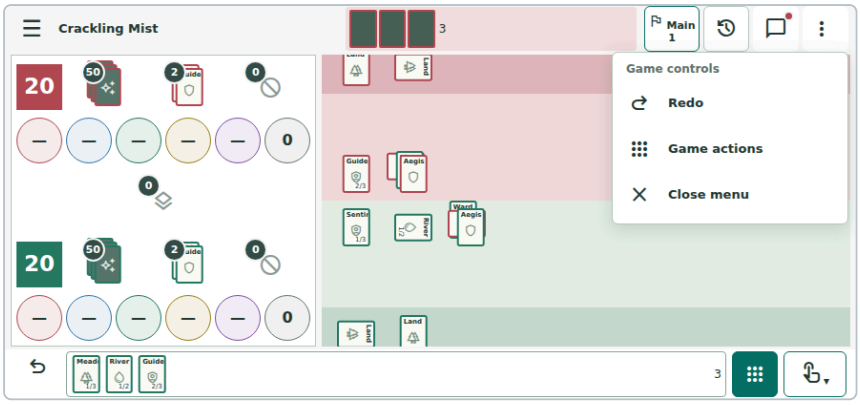

Undo availability/target remains based on shared current history, not the personal historical cursor. When a server accepts a locally withdrawn request later, its accepted effect still arrives normally. Cancel/Return remain through normal contextual navigation/accessibility; no banner is required to carry them. The selected intent and server boundary remain explicit internally, never silently replaced with the live head just because they are not printed in a banner.

Basis: D-179, D-224/D-233/D-245, D-258/D-277 and D-291.

G03 — Explicit Redo and mode chooser routes

G03 portrait — overflow with explicit Redo and Game actions; Chat has its own button

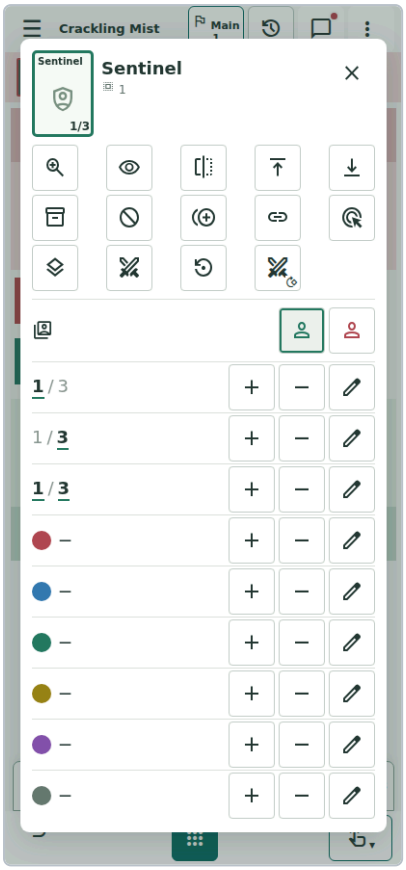

G03 landscape — reachable explicit Redo alternative above fixed live controls

Redo arbitration: tap Undo invokes Undo only; recognizing a hold invokes Redo only. No Undo on press-down, no Undo on release after a hold and no automatic repeat is selected here. The controls menu exposes labeled Redo and native accessibility must provide an equivalent explicit action, without requiring a timed hold. Both routes use the same server-authoritative per-player game stack, eligibility and retry rules. Exact hold interval/feedback is still UI work.

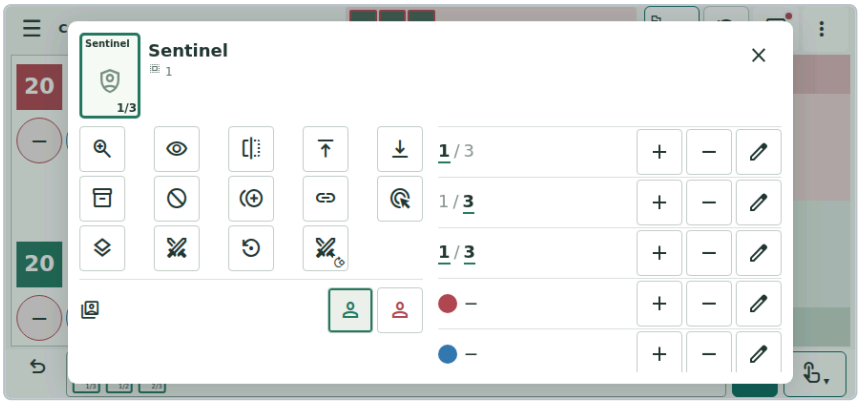

Menus: overflow is a proposed route to Game actions, not a newly invented settings suite. Game actions must retain existing tracking, random, token, combat and ending paths; this packet does not yet picture their complete menus or editors. The separate bottom-right mode square opens Normal / Select / Ping, rather than silently cycling modes. It does not open this overflow menu. Choice-sheet layout remains unpictured; normal/Select/Ping tap semantics are already specified. Close/Back dismisses without a shared edit. Chat now has a separate direct button/panel (D-297), not an overflow-only route.

Basis: D-235/D-259, D-267/D-281 and D-291. No claim that an incidental enabled/disabled color proves the complete eligibility computation.

G04 — Card context actions

G04 portrait — card action dialog including Change owner

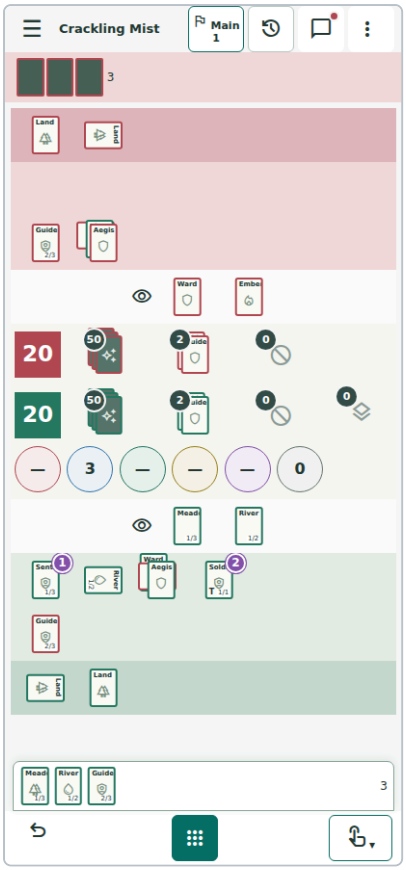

G04 landscape — compact card action grid with close at top-right

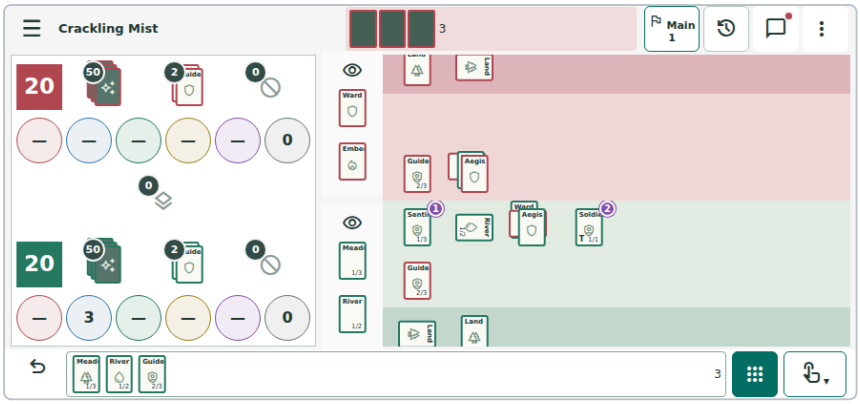

Normal single tap opens this card’s Actions without rotating it. A selected card binds the selected set; an unselected card binds only itself and preserves prior selection. **D-297:** grouped square **icon-only** buttons show Library top/bottom, Graveyard/Exile, inspection and existing card tools, plus **inline owner choices**. Corner text has direct +/−/Set rows for left/right/both numbers; each of six counter colors has direct +/−/Set, even when absent. The underlined number(s) identify the addressed part of the one corner string; this is not separate P/T engine state. No Card text / Counters / Owner category submenu adds another tap. Inspect other side retains its logged disclosure rule; opening a menu alone logs nothing. Orientation still uses normal double tap, with explicit Tap/Untap commands in Select mode, not a new normal-mode Tap button. This example is not every contextual/source/occurrence menu.

A dialog is the owner’s accepted alternative to their initial floating-buttons request. The title-corner preview shows the context card’s current permitted visual state, and stays visible while direct controls scroll. G06 shows it updated after retained edits. Opening/closing creates no shared edit; outside tap, X and native Back dismiss without recalling earlier submitted requests. Completed corner/counter +/−/Set keep the menu; successful Move to Graveyard closes it, as already agreed. No universal close/stay rule is invented for all other actions. Required Set editor/inspection/Link endpoint selection completes its chosen action, not an intermediate action-category menu. Every icon retains an accessible name and actual availability; hidden faces/names never leak into the preview. **Basis:** D-54/D-61/D-63/D-67, D-248/D-252/D-267 and D-295/D-297.

G05 — Tokens, numbered pings and reveal placement

G05 portrait — token, two event-scoped pings and reveal trays between libraries and fields

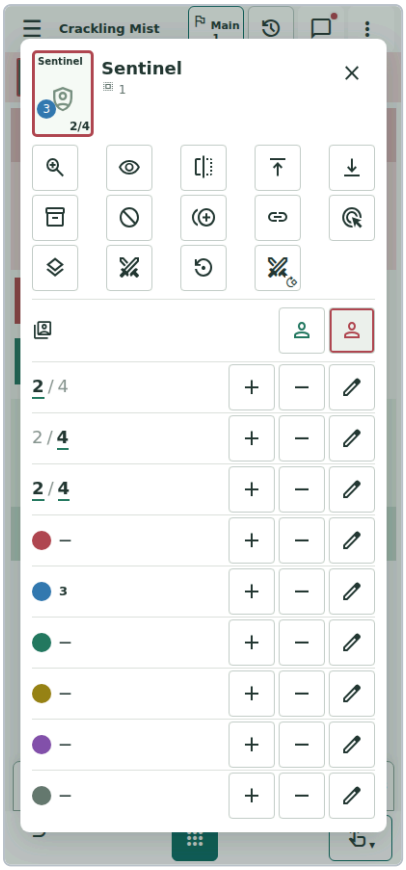

G05 landscape — reveal gutter between left libraries and battlefield, token and owner borders

The Soldier is a token (small **T** badge), with the same owner-colored border and equal battlefield footprint as a real card. P/T is bottom-right. A red-bordered Guide on the green field explicitly demonstrates that placement is not ownership. Tokens retain the existing disappearance rules, not an ordinary card’s special- zone destination behavior.

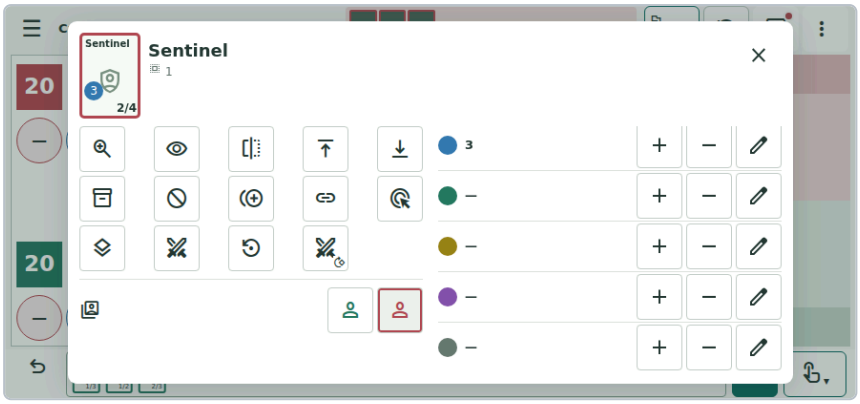

1 / 2 use the same standard numbered ping marker in one event context; they are not counters, target assignments, custom player styles or persistent overlays on later events. Retained review of that event reproduces them. Markers follow their captured source/destination rules and must not cover the bottom-right P/T.

Accepted reveal trays sit between each player’s Library and battlefield: above/ below the central portrait dock, or in a gutter immediately right of landscape libraries. This depicts already accepted fixed contents, not a new inspection request, refill, altered audience or unlogged face exposure. Further contents/ dismissal/disclosure variants remain visual completion. **Basis:** existing token, ping and View/Reveal contracts; D-295 placement.

G06 — Retained card actions after edits

G06 portrait — retained direct actions with red owner, 2/4 and blue counter 3 in preview

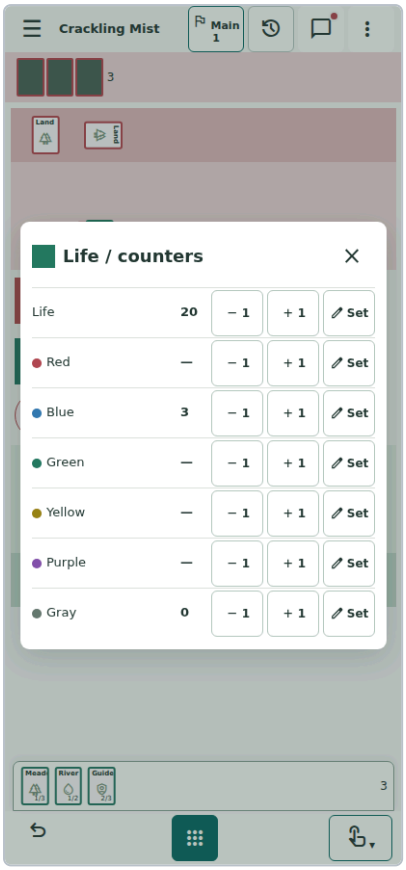

G06 landscape — scrolled direct values with persistent updated title-corner preview

D-297 supersedes the separate owner chooser: the same action dialog stays open, now with a red owner border, corner text **2/4** and blue counter **3**. This is a static after-edit example, not a working sequence or one atomic multi-field edit. Landscape scrolls the values to show the lower colors while the preview remains visible. +/−/Set retention does not require reopening the menu between adjustments.

Inline owner choices use player colors without printed player names. Accessible labels identify both participants, the card and current selection. Choosing the other owner submits the ordinary connected shared card edit, with immediate prediction; choosing the already-current value is a no-op. No additional Save/confirmation. Owner starts as creator/bringer, is independent of field position and never restricts either player’s editing rights. The border updates on all live views/ projections, devices and historical boundaries under normal recovery/eligible Undo rules. This does not add controller, permission or rules-engine semantics. **Basis:** D-295/D-297; primary owner/field contracts in board-and-controls.md.

G07 — Life and player-counter context menu

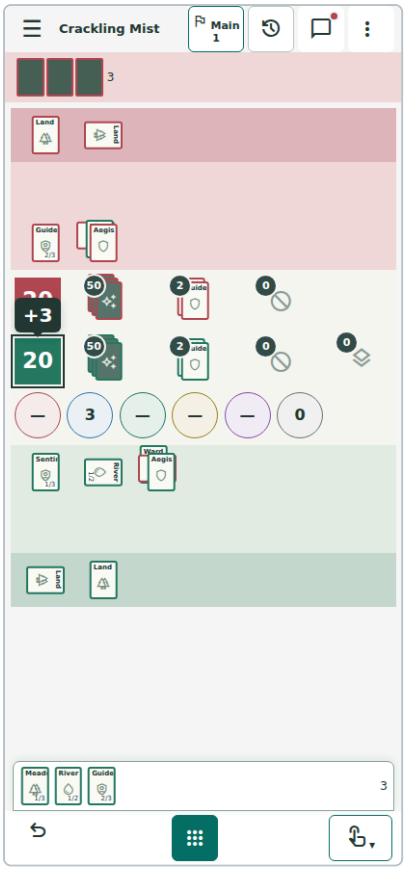

G07 portrait — life-tap menu with life and every player-counter color

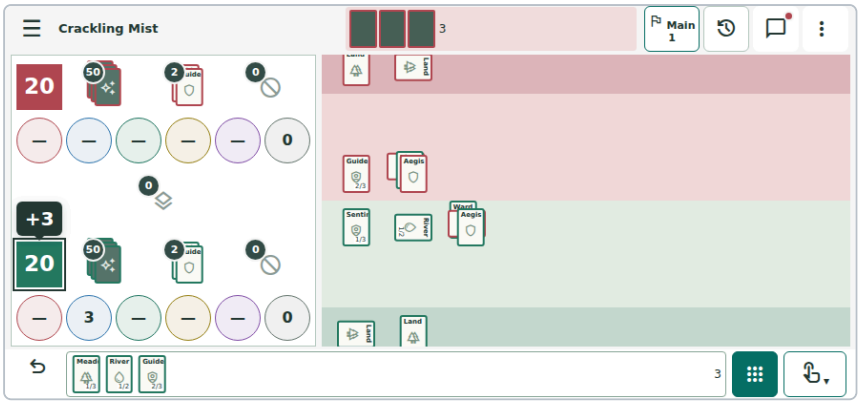

G07 landscape — scrollable life and player-counter context menu

Tap either player's life square to open these controls for that player. Life and each color expose -1/+1/Set; no initialization submenu. The example has Blue **3** and Gray **0**; dashes denote absent colors, not stored zero strings. Set may enter normal counter text; nonnumeric text disables arithmetic, not Set. Existing retained-menu/trimmed-empty rules persist. Both participants may edit either player. A hidden all-empty/zero portrait counter row is still reachable here. This is a context-menu mock, not a functioning editor or completed keyboard state. **Basis:** D-58/D-61/D-67/D-68 and D-296.

G08 — Life drag: positive preview before release

G08 portrait — local +3 life preview while underlying life remains 20

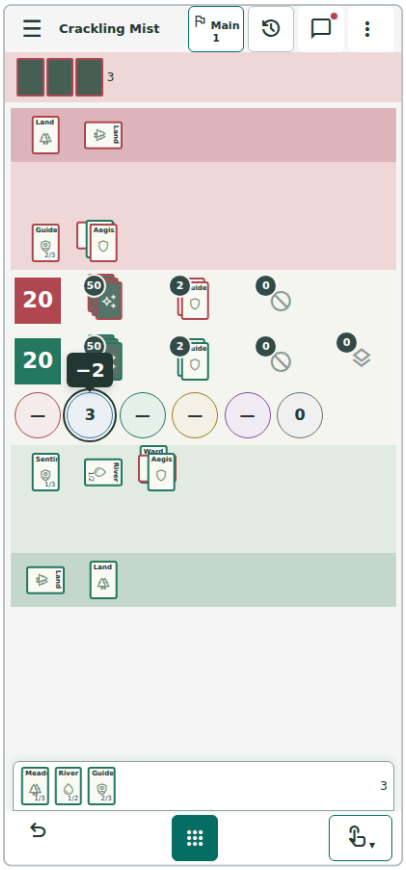

G08 landscape — +3 preview beside life, Stack between player-info blocks

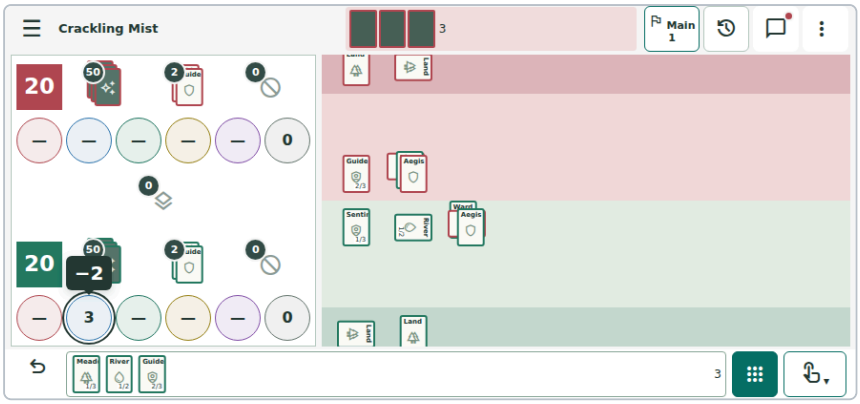

Drag up to increase or down to decrease the captured numeric life/counter field. The floating **+3** is a local, uncommitted delta; life still reads **20**. A valid release submits **one +3 relative edit**, not Set 23 or three +1 requests. Server arithmetic uses its then-current value, so compatible concurrent changes survive. Only after release does normal request prediction begin. Cancel or release at zero emits nothing; a recognized drag cannot also open the life menu.

Incoming sync is not paused, preview never moves to a different participant/color, and disconnected release cannot create offline work. Menu/accessibility -/+ /Set remain alternatives; exact distance/step/slop is geometry to review. **Basis:** D-186/D-187/D-259 and D-296. Inert snapshot, not an executed gesture.

G08b — Player-counter drag: negative preview

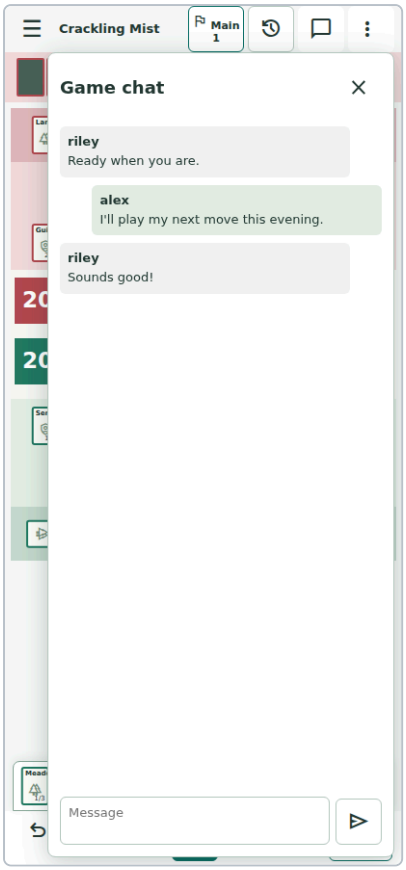

G08b portrait — local minus-two preview while blue counter remains three

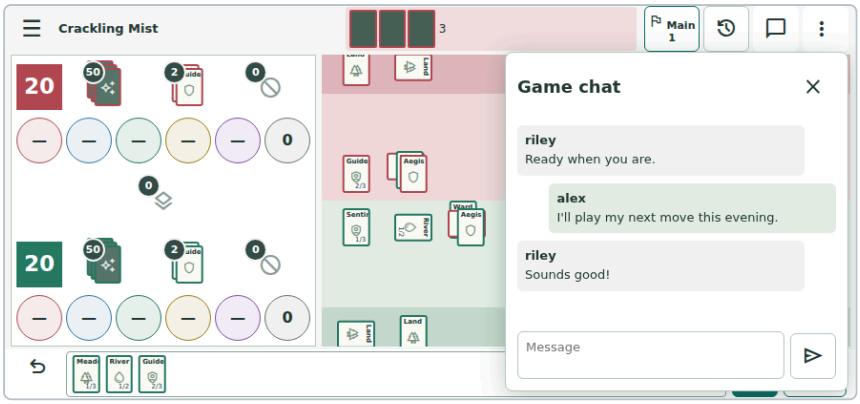

G08b landscape — negative counter delta before release

Same gesture family as G08, now dragging Blue downward: **−2**, while its current text remains **3**. Release sends one relative −2 edit. This is a separate frozen example, not simultaneous life/counter drags. Nonnumeric text is not coerced into a number; absent-counter arithmetic retains its zero starting-point rule. The active Blue value makes this player's portrait row visible; the opponent's all- empty/zero row stays hidden. No authoritative intermediate edit is created.

G09 — Direct game-chat panel

G09 portrait — game-wide chat panel, message field and direct send

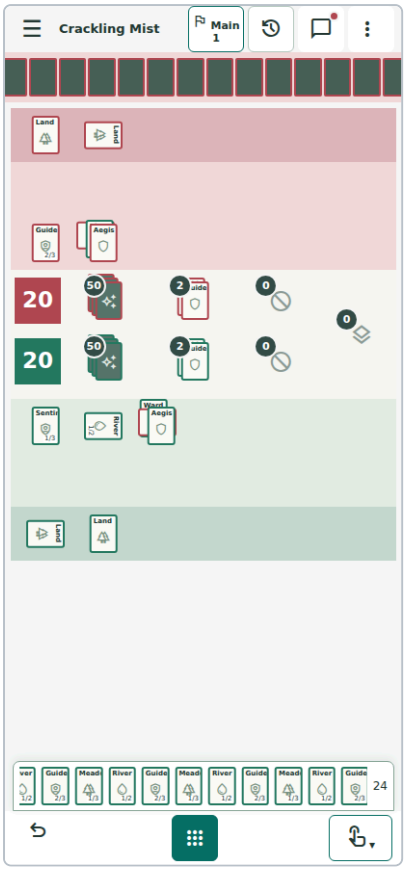

G09 landscape — side chat panel with reachable close and composer

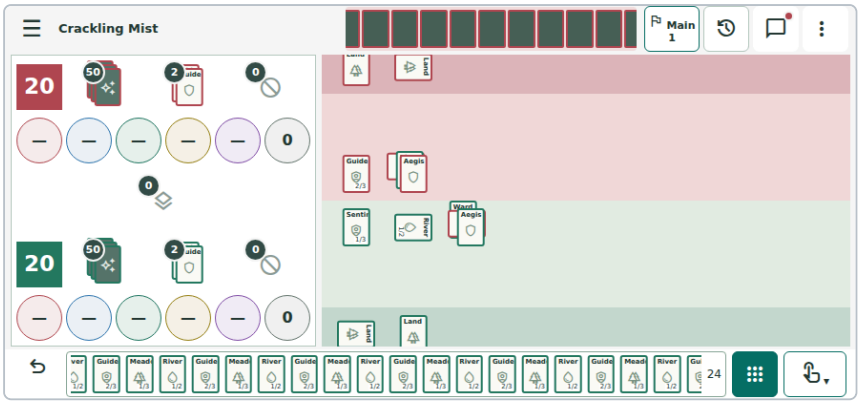

The separate top Chat button opens this panel directly. Closed-panel table/history examples show its unread bubble; this example has presented all three messages, so the bubble is absent. Incoming messages remain unread until actually presented in the panel, not merely because it opened while they were offscreen. Own echoes do not create incoming unread. Viewing is personal UI, not a read receipt, presence signal, gameplay mutation or history activation/fork. Game-wide chat is not filtered to the selected event/branch; event comments stay separate.

Close/native Back dismisses the panel. Sending the completed message uses the existing connected chat request; no gameplay Send, automatic posting of drafts, sent-message Edit/Delete/Undo or new alert category. Keyboard/large-text variants still need visual review. **Basis:** D-94/D-240/D-259 and D-297.

G10 — Compact overflowing hands

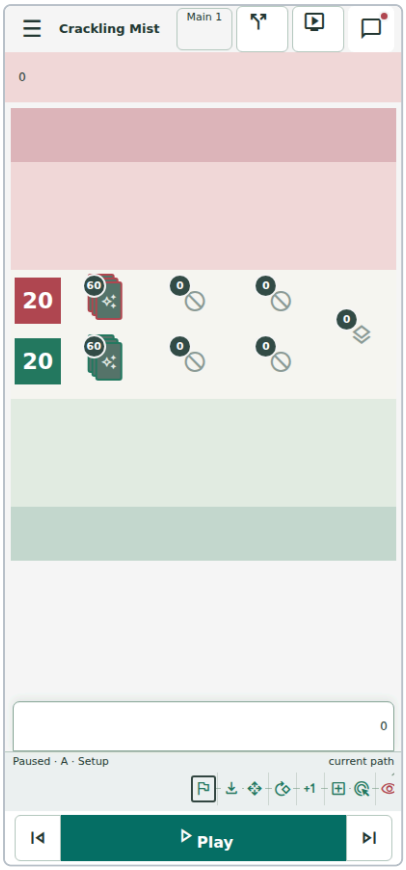

G10 portrait — 24-card hands, compact spacing and partial cards at both pan edges

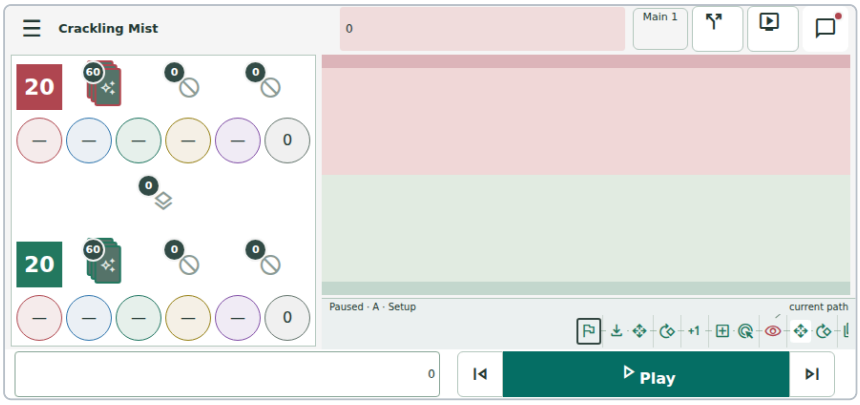

G10 landscape — hands pan within existing top and bottom control rows

Both example hands contain **24 cards** at the same 40 px table scale, with small gaps instead of battlefield-sized empty footprints. Captures show a static mid-pan position, not a functioning swipe. Every first/last card remains reachable by left/right pan and native accessible navigation; the count is total membership, not only visible cards. Covered opponent cards disclose no names/art. Landscape own Hand occupies the quick-action row, while opponent Hand is trialed in the existing top row, leaving the battlefield free. Pan and actual card dragging must remain distinct, with no request from navigation/cancel or retargeting on sync. **Basis:** D-267 scene/input, D-296 uniform scale and D-297.

H04 — First event stays centered

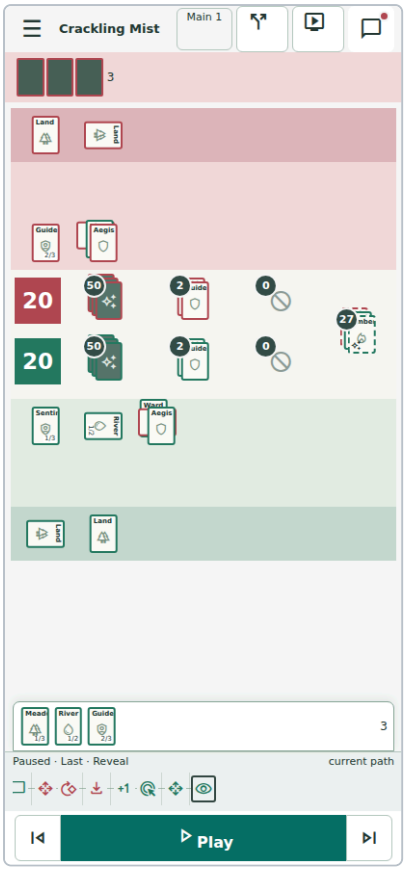

H04 portrait — first event under fixed center selection, left half empty

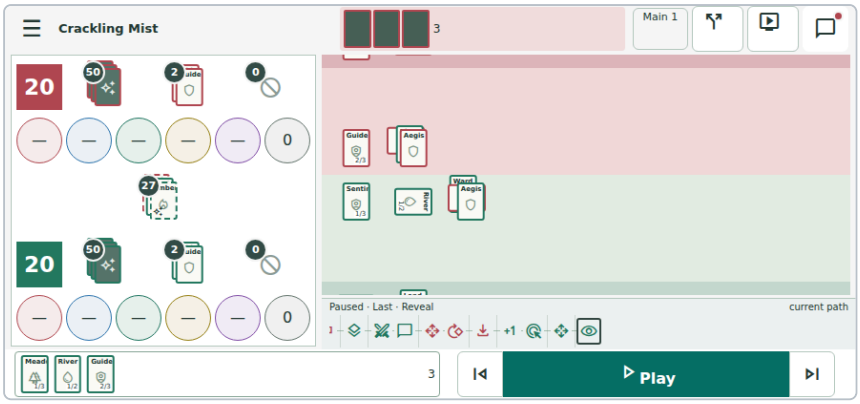

H04 landscape — first event centered in the timeline viewport

The path starts at the selection square in the exact center; there are no earlier nodes or continuing path line in the left half. This setup example has full libraries and no automatically drawn Hand/battlefield cards. The retained future extends right; its existence does not activate it. The fixed square uses the same viewport anchor as H01/H02/H05. **Basis:** D-297; existing exact-boundary playback.

H05 — Final event stays centered

H05 portrait — final event centered, right half empty

H05 landscape — stationary center selection at the path endpoint

The final selected event does not slide to the right edge. The path lies left of the fixed center square; the unused right half stays empty. First/last examples illustrate anchoring, not a complete executable game/replay trace. An only-event path leaves both halves empty. Normal live-boundary catch-up, branch navigation, deleted-cursor fallback and sync rules remain unchanged; filling empty space must never choose another boundary or fabricate events. **Basis:** D-297.

Copy audit — suggested further deletions

All 41 current pictured states, both orientations, audited. Round 2's table is retained cumulatively; D-294–D-297 dispositions below mark selected/superseded items without turning all earlier suggestions into approvals. This table is owner-review advice, **not a new approval list for already confirmed outcomes**. "Suggest" items are deliberately **not all removed** from the mockups yet. Existing F06/F13/F15 and the confirmed route changes already remove the obvious superseded mode descriptions, "With" prefixes and gameplay button tutorials; behavior remains in the specification notes. No blanket deletion of labels, errors or lifecycle state.

Screen(s)	Suggested deletion / shortening	Keep / reason
A01	No additional explanation deletion suggested.	Exact selected brand/subtitle, field labels and credential error are intentional.
A02 / A02b	Delete "Create your player account", "Your username is visible to players", "Your email stays private", and "Already have an account?". Keep just Sign in link.	Username/Email/Password labels, validation and submit action. Privacy policy stays in specs; no repeated on-form tutorial needed.

Screen(s)	Suggested deletion / shortening	Keep / reason
A03	No further helper paragraph to remove.	Neutral submitted reset outcome avoids account-existence disclosure; it is necessary feedback, not instruction.
A04	No further explanation to remove.	New password label, eye, submit and Sign in route; invalid-link outcomes still required.
N01 / N02	No additional text deletion suggested after F09/F13.	Logo, destinations, fixed Logout and compact meaningful game statuses. No icon tutorial.
P01 / P03	Round 2 suggested “Active game” → “In play” and omitting “pending” beside the invitation count. D-294 now shows In play and named games; count wording suggestion otherwise persists.	Required game name, opponent metadata, state/date and Accept/Decline. P03 uses top-right X to dismiss.
P05	No extra naming tutorial paragraph on the screen.	Required Game name, recipient, reroll and Create & invite; nonblank generated names can be accepted.
P04	**Do not delete** the short both-players/no-restore warning.	Essential scope information before a newly added destructive shared action.
P02	Delete “Invite creates a waiting game lobby.” Consider deleting redundant “Find player” heading above Search usernames.	Search field label, result/contact headings and empty/error feedback.
D01	Delete duplicated right-side “60 / 15” pills when the same main/side counts are already beside the deck name.	One labeled count pair, deck name/cover and bottom Import.
D02	No further helper deletion in revised composition. Old saved-copy-isolation banner is no longer pictured; keep that rule in notes.	Name, section/count tabs, Edit actions, quantities and art. Expanded Edit heading identifies the shown menu state.
D03	Delete “Correct the pasted text; nothing has been saved.” if the unresolved-line error remains specific.	Line number/name and “could not be resolved”; unavailable Review import remains clear. Transport failure still needs its actual error.
D04 / D04b	Old “All imported entries resolved to definitions”, save-mode descriptions and saved-copy banner are removed with the superseded mode selector. No further deletion suggested.	Section counts, name field, result preview and Save/Edit actions.
D07	No paragraph explaining Overwrite/Merge on the screen. None is pictured.	Deck target, mode labels/selection, Deck list label and validation. Semantic help remains available non-permanently/accessibly.
D08	No instructional text to delete.	Card name/art/text and Close; do not remove card content as if it were UI filler.
D05	Delete “Choose one card from this deck to display as its cover artwork” and “Selected for Training deck. Only updates cover artwork; does not edit deck cards.” Remove “[Grayscale art]” placeholder captions from eventual real-art cells.	Deck identity, selection mark, card names, preview and confirmation. The bracketed text is mockup provenance, not app copy.

Screen(s)	Suggested deletion / shortening	Keep / reason
D06	Round 2 suggested shortening no-trash/copy scope. **D-294 selects “Deletion cannot be undone” only**; the longer dialog explanations are removed. Background “Tap row…”/duplicate-count suggestions persist.	Deck identity, destructive label, right-corner X and equal action pair; copy isolation remains in behavior notes, not dialog copy.
L01	Delete “Leaving this screen keeps the lobby”; remove parenthetical “(Inviter)”, “(Opponent)” and “(Example)” where identity/state already conveys them.	Opponent identity, actual decline/pending state, selected deck/counts, starter/Ready/Reinvite. No presence pulse should imply online status.
L02	Delete “Accepting the invitation did not ready you. Choose your deck to proceed” and redundant “Select a saved deck” below No deck selected. Remove redundant starter captions “You first / Opponent / 50 / 50”.	Choose deck and a concise disabled-Ready reason. The false “deck … locked for this match” claim is corrected now, not preserved as a policy or pending suggestion.
L03	No explanatory paragraphs to remove. D-294 supersedes per-row Select with bordered draft selection and one bottom confirmation.	Deck name/counts, bottom Import/Use selected deck and contextual Close/native Back; no app arrow.
L04 / L04b	Old size/selected-row/sync helpers are absent. No tap/drag tutorial paragraph. F35’s fixed fading result is **necessary action feedback**, not explanatory clutter.	Mainboard/Sideboard/counts, tappable/draggable 1/∞, art/name/quantity and latest actual move in reserved space. F36 list reflow is caused by transfer, never by text fade.
L05	Delete “riley has joined the lobby and is selecting their deck” and the full footer “Your Ready stays set … both players are ready.” Shorten “You are ready. Waiting for riley to ready up” to “Waiting for riley”. Remove redundant starter captions.	Own Ready/check, opponent Not ready, Withdraw Ready and setup controls.
L06	Delete “Leaving the lobby normally does not cancel it” plus the background leaving-lobby helper.	Dialog must still say it removes the unstarted game and pending invitation. Keep/Cancel names stay explicit.
Retired G00	Round 2 suggested shrinking/moving pilot explanations. **D-294 removes the whole obsolete mockup from the current review**.	Raw source/older captures remain provenance outside the current packet, not an empty gameplay design.
U01	D-295 selects no offline-review button or redundant recovery helper.	Reconnecting, concise restriction and Back to games list only; never claim an unknown request failed.
G01 / G02	D-295 selects removal of area/row labels, names and Life text; fixed-Hand/covered tutorial copy is absent.	Hand count, phase, selection, colored life number, zone/Stack counts, projection distinction. Identity remains accessible.
H01 / H02	D-295 removes diagram labels and scrub tutorials; type icons replace sparse generic dots.	Paused/Playing, exact boundary/type/branch context, transport and Continue/Return actions.
G04 / G06	No explanation paragraph in the dialog.	Card/action identity, owner colors/current selection, accessible participant names and close.
G05	No Battlefield/Reveal/player-name headings.	Revealed card contents, token badge, numbered pings, owner borders and P/T.

Screen(s)	Suggested deletion / shortening	Keep / reason
H03	**D-296 supersedes the earlier keep-banner proposal: no Continuing from banner at all.**	Internal captured boundary/intent, normal play controls and contextual Cancel/Return remain; arming alone does not fork.
G07 / G08 / G08b	No drag tutorial, extra confirmation or shortcut tooltip on the table.	Menu field/color/value controls, signed delta preview and accessible meanings; values remain unchanged before release.
G03	Delete “Hold Undo for Redo, or choose Redo here. Ordinary eligibility applies.” and inherited diagram labels.	Explicit labeled Redo/Game actions menu entries and actual availability feedback; Chat now has its own button (D-297).
G09 / G10 / H04 / H05	No swipe, unread or endpoint tutorials printed on the screen.	Actual messages/composer, total hand counts, exact timeline boundary/type and normal transport; semantics stay in notes/accessibility.

No layout-driven explanation deletion here changes the server rules, retry/Ready semantics or accessibility help. If accepted later, apply the named suggestions as a new cumulative feedback round and recapture/rebuild the full same-URL packet.

Whole-journey interaction budgets

These are draft counts for the proposed route, not measured Android tests. A “tap” means one explicit activation; typing/pasting, scrolling and keyboard dismissal are additional interaction cost, not hidden zero-cost steps.

Starting state → goal	Proposed route and explicit activations	Additional work
Main menu → existing active game	Games → Open: **2 taps**, or a visible landscape navigation game row: **1 tap**.	Portrait drawer → game: **2 taps**; list scrolling if needed.
Main menu → accept a visible invite	Games → Accept: **2 taps**, arriving in the same lobby, not Ready.	Invitations follows Games; scrolling if needed.
Main menu → invite a saved contact	Contacts → Invite → Create & invite: **3 taps**, accepting the suggested nonblank name and arriving in lobby.	Custom name/reroll adds work; contact-list scrolling if needed.
Main menu → search, add and invite	Contacts → Search field → Search → Add contact → Invite → Create & invite: **6 taps**.	Type username; optional custom game name/reroll and keyboard/scroll add cost.
Main menu → save a new imported list	Manage decks → Import → list field → Review import → name field → Save deck: **6 taps**.	Paste/type list and name; correction/keyboard/scroll cost.
Accepted lobby without a deck → Ready	Choose deck → highlight row → Use selected deck → Ready: **4 taps**.	Row highlight is personal; only bottom confirmation changes preparation. No legality/size confirmation.
Preparation open → transfer one/all copies	Tap **1 / ∞**: **1 tap**, or drag the control to the other panel: **1 drag**.	One gesture sends once; fixed fading latest-move feedback. Emptied rows quickly fade/collapse and following rows slide up; no Send or acknowledgement wait.
Existing deck → update card list	Edit → Import decklist → list field → Review import → Save deck: **5 taps**.	Paste/type; default Overwrite, optional Merge toggle adds 1 tap. No target picker.
Games row → delete active game	Long press → Delete game → confirm Delete game: **1 hold + 2 taps**.	Confirmation explicitly says both players; dismissing sends nothing.
Ready lobby → leave without withdrawing	Android native Back: **1 system action**.	No app Back/home arrow, cancellation or publication prompt. Hamburger destination is an alternative.
Saved-deck details → delete collection entry	Delete saved deck → confirm deletion: **2 taps**.	Copies selected in games survive.
Live → exact history → armed continuation	History → drag timeline → Continue playing from here: **2 taps + 1 drag**.	If playback is running, dragging itself pauses before scrubbing; no separate Pause tap. First gameplay mutation is additional and alone creates/activates continuation.
Live → eligible Redo	Hold Undo: **1 hold**, or overflow → Redo: **2 taps**.	No earlier Undo emitted; hold timing/native accessibility still need validation.
Live → game chat	Chat: **1 tap**.	Read existing messages; typing/send is additional. No overflow detour or shared read receipt.
Card → repeated field adjustment / owner edit	Card → direct icon: **2 taps** initially; next +/− is **1 tap** while retained. Owner choice likewise **2 taps** from the table, no chooser submenu.	Set needs actual text editing/completion; Link needs endpoint selection. Scroll direct controls when necessary; ordinary 48 px buttons are not reduced.

The import review split, cover confirmation and cancellation dialog are intentional pilot proposals whose interaction cost should be reviewed, not silently declared optimal. Reaching a visible button may require scrolling in short landscape or with a keyboard; the later large-text/keyboard review must count that cost too.

Coverage and limits

Pictured: 41 primary screen/state drafts (26 original Stitch-derived states, some locally recomposed, plus N02, P03–P05, D07/D08, G04–G10 and H04/H05), two scrolled continuations, L04b's faded feedback and G08b's negative preview: **45 states / 90 captures**. These include the shared navigation, inline sign-in error, submitted reset request, unresolved import, two import save modes in contextual D07 (Overwrite selected), collection-deletion modal, declined inviter lobby with Reinvite, game context/active-delete confirmation, full card inspection, mandatory named creation, no-own-deck lobby, preparation, accepted Ready, cancellation modal and reconnect dialog, plus fifteen primary gameplay states and the G08b continuation: live, populated Stack/combat, paused exact history, running playback, armed continuation, explicit Redo menu, card actions, token/ ping/reveal presentation, retained updated actions, player-value context, signed drag previews, game-chat panel, overflow hands and both timeline endpoints.

Described but not separately pictured: clean authentication forms, network and field errors, invalid reset link, empty/loading/search-no-results lists, rename field editor, import lookup-in-progress/save failure, Merge-selected preview, returned-lobby not-ready state and successful reconnect. These still need visual state completion before claiming that every non-gameplay state is designed. Gameplay expansions still needed include alternate Hand expansion, phase/mode choice sheets, remaining card/zone action menus, gameplay-specific inspector/disclosure states (D08 pictures inspection in a deck context), further View/Reveal variants, dense/empty combat variants, branch selection/return/archive views, further chat/comments and ending dialogs, plus selected/conflict/reconnect/large-text/gesture variants over the real board. Static examples do not settle all camera bounds, hit regions or timings.

Not claimed: final visual style, full keyboard/large-text/tablet/foldable coverage, touch/accessibility usability validation, live Android behavior, exhaustive state/concurrency testing or a passed UI/review gate. Platform notification permission dialogs/settings belong to Android; this revision removes their old main-menu shortcut, not OS authority or notification behavior. No custom mute/settings screen or replacement shortcut is invented.

Behavior and UI discrepancies found during review are documentation/design work, not permission to add features or start application implementation.

Provenance and review artifacts

The layouts were requested from Google Stitch in the private design project **6617750535460836476** on 2026-10-21. Static HTML exports, generation briefs and the screen manifest are retained with this packet. Each responsive source is captured at both fixed viewports; no portrait screenshot is stretched to make a landscape image. Review captures, not Stitch's default large canvas preview, are the images embedded here.

D-292 owner revision: all sources/captures now apply the cumulative feedback: fullscreen, current branding, same-card sign-in, reset-copy removal, shared Menu/Games navigation and combined games-before-invites browser. N02 is an additional locally composed state; these revisions were made to local inert derivatives, not claimed as new cloud edits. Historical generation briefs/raw sources are retained unchanged as provenance, not current instructions.

D-293 owner revision: auth top-Back removal, provisional local ATW hat logo, matching icons, bare game names/chevrons, contextual reinvite/long-press/shared deletion, bottom new-import/contextual Overwrite–Merge, drag preparation and art inspection. D02/D04/L04 use new local compositions; their prior derivatives and raw cloud exports are retained as provenance. P03/P04/D07/D08 are four new local states, not Stitch generations. The full-screen copy audit above distinguishes suggested future deletions from this round's confirmed removals. All earlier feedback persists except explicitly recorded supersessions. No new cloud or application work claimed.

D-294 owner revision: named games with procedural suggestions and persistent creation dates; no app Back/home arrows; shared title/hamburger/exit or Cancel row; equal button pairs; right-corner dialog close; border-only cover choice and shorter deck-deletion warning; opponent-slot Reinvite; draft deck selection plus bottom confirmation; narrow **1 / ∞** markers. P05 replaces the retired G00 in current coverage. Follow-ups add L04b: **35 states / 70 captures**. U01 uses a real table. Prior local sources and retired G00 raw/capture provenance are retained, not embedded as current screens. F23–F36 record explicit supersessions, including

direct 1/all tap transfer, fixed fading result text and short fading/sliding row removal; earlier feedback and unselected copy suggestions continue. This remains inert documentation, not app implementation, a new cloud generation, final UI approval or a passed gate.

D-295 owner revision: F37–F47 add the naming dialog/select-all contract, one deck-delete title, games-list-only reconnect escape, unruled/equal-footprint fields, red opponent area, owner borders/action, compact life squares, bottom-right P/T, bounded corner-peek Stack rendering, trial combat placement/dividers, reveal trays and dense type-icon history. G04/G05/G06 are new local inert states. One shared `table-round4.html`/CSS composition is captured with a static variant attribute set by documentation tooling, not executable app logic. Previous local sources/cloud exports are retained. Full edition: **38 states / 76 captures**; earlier edition counts below/above are historical, not coverage deletion.

D-296 owner revision: F48–F57 merge search/results, move landscape Stack between side-panel player info, enforce one card zoom across areas/orientations, color timeline types by author with effective-group dividers, standardize top-left total circles and add conditional player-counter rows, life menu and release-only drag previews. History transport has text/attached buttons and paused-hold continuation; the top route stays and H03 loses its banner. G07/G08/G08b add three inert states: **41 states / 82 captures**. `table-round5.css` overrides prior geometry; inert templates are materialized by documentation capture only, with a static landscape camera and Stack relocation. No executable application interactions/cloud edit.

D-297 owner revision: F58–F68 add the login logo, subordinate search labels, readiness icons, compact pannable hands in existing landscape control rows, content-width combat/insertion targets, evenly spread circular player counters, fixed-center timeline/endpoints, separate chat button/unread panel and direct square icon card actions with retained title-corner preview. The follow-up accepts a dialog instead of the initial floating-only preference. G06 is now a retained updated action dialog, not an owner submenu. G09/G10/H04/H05 add four local inert states: **45 states / 90 captures**. `table-round6.css` retains earlier direction except explicit supersessions; static repetition/scroll/center offsets are document tooling, not executable application interactions or a new cloud revision.

See generation briefs and source manifest. The exported HTML is design material with executable interactions removed, not production frontend/application scaffolding. Any documented normalization or repair of generated presentation is recorded in the manifest/build notes rather than silently attributed to Stitch.

Gameplay source distinction: six new designs exist in the same Stitch project. Their raw `.stitch.html.txt` outputs are retained, but the packet captures **substantially locally recomposed inert derivatives**, not pixel-identical cloud exports. The derivatives harmonize G01’s gray/teal abstract-card vocabulary across all six states, fit both battlefield halves into the sparse initial framing, restore clipped history controls, separate fixed docks from the board camera and remove invented Pass/concession/Declare Action wording. H01/H02 use a sparse closed-combat historical boundary; G02 illustrates populated combat separately. The repaired reference HTML/CSS was then sent back to Stitch’s edit operation, creating **six corrected editable cloud revisions** in the same project. Initial and revised raw outputs and their resource IDs are retained in the manifest; a cloud revision does not prove pixel identity with the local derivative. Use this packet for the checked portrait/landscape comparison, and Stitch for the editable originals/revisions; neither is an approved implementation or final geometry.

Review repairs included removing Stitch-invented 60/15-card size restrictions from lobby/preparation wording, describing definition resolution rather than catalog authenticity, restoring a clipped landscape Back target and widening a landscape reset form that had accidentally retained its portrait width limit. The minimum-target normalization also makes some short landscape panels scroll; it must not be mistaken for a completed native accessibility review.

The UI draft index explains rebuild and private hosting. HTML and PDF are compiled from this same Markdown and use the same embedded image files. Review progress is not a separate source of game behavior.
